LHC COMPUTING GRID

LCG - VOBOX - GENERIC CONFIGURATION REFERENCE

Document identifier:	**LCG-GIS-CR-VOBOX**
EDMS id:	**none**
Version:	
Date:	**January 16, 2006**
Section:	**LCG Grid Infrastructure Support**
Document status:	**ACTIVE**
Author(s):	LCG Deployment - GIS team;Retico,Antonio;Vidic,Valentin;
File:	**VOBOX**

Abstract: *Configuration steps done by the YAIM script 'configure_VOBOX'*

CONTENTS

1. INTRODUCTION

This document lists the manual steps for the installation and configuration of a LCG VOBOX Node. Furthermore it provides a specification of the YAIM functions used to configure the node with the script-based configuration.

The configuration has been tested on a standard Scientific Linux 3.0 Installation.

Link to this document:
This document is available on the *Grid Deployment* web site

```
http://www.cern.ch/grid-deployment/gis/lcg-GCR/index.html
```

2. VARIABLES

In order to set-up a VOBOX node, you need at least the following variables to be correctly configured in the site configuration file (site-info.def):

BATCH_LOG_DIR : Your batch system log directory.

BDII_HOST : BDII Hostname.

CE_BATCH_SYS : Implementation of site batch system. Available values are "torque", "lsf", "pbs", "condor" etc.

CE_CPU_MODEL : Model of the CPU used by the WN (WN specification). This parameter is a string whose domain is not defined yet in the GLUE Schema. The value used for Pentium III is "PIII".

CE_CPU_SPEED : Clock frequency in Mhz (WN specification).

CE_CPU_VENDOR : Vendor of the CPU. used by the WN (WN specification). This parameter is a string whose domain is not defined yet in the GLUE Schema. The value used for Intel is "intel".

CE_HOST : Computing Element Hostname.

CE_INBOUNDIP : TRUE if inbound connectivity is enabled at your site, FALSE otherwise (WN specification).

CE_MINPHYSMEM : RAM size in kblocks (WN specification).

CE_MINVIRTMEM : Virtual Memory size in kblocks (WN specification).

CE_OS : Operating System name (WN specification).

CE_OS_RELEASE : Operating System release (WN specification).

CE_OUTBOUNDIP : TRUE if outbound connectivity is enabled at your site, FALSE otherwise (WN specification).

CE_RUNTIMEENV : List of software tags supported by the site. The list can include VO-specific software tags. In order to assure backward compatibility it should include the entry 'LCG-2', the current middleware version and the list of previous middleware tags.

CE_SF00 : Performance index of your fabric in SpecFloat 2000 (WN specification). For some examples of Spec values see http://www.specbench.org/osg/cpu2000/results/cint2000.html.

CE_SI00 : Performance index of your fabric in SpecInt 2000 (WN specification). For some examples of Spec values see http://www.specbench.org/osg/cpu2000/results/cint2000.html.

CE_SMPSIZE : Number of cpus in an SMP box (WN specification).

CLASSIC_HOST : The name of your SE_classic host.

CLASSIC_STORAGE_DIR : The root storage directory on CLASSIC_HOST.

CRON_DIR : Yaim writes all cron jobs to this directory. Change it if you want to turn off Yaim's management of cron.

DCACHE_ADMIN : Host name of the server node which manages the pool of nodes.

DPMDATA : Directory where the data is stored (absolute path, e.g./storage).

DPM_HOST : Host name of the DPM host, used also as a default DPM for the lcg-stdout-mon .

EDG_WL_SCRATCH : Optional scratch directory for jobs.

EDG_WL_SCRATCH : Optional scratch directory for jobs.

FTS_SERVER_URL : URL of the File Transfer Service server.

GLOBUS_TCP_PORT_RANGE : Port range for Globus IO.

GRIDICE_SERVER_HOST : GridIce server host name (usually run on the MON node).

GRIDMAP_AUTH : List of ldap servers in edg-mkgridmap.conf which authenticate users.

GRID_TRUSTED_BROKERS : List of the DNs of the Resource Brokers host certificates which are trusted by the Proxy node (ex: /O=Grid/O=CERN/OU=cern.ch/CN=host/testbed013.cern.ch).

GROUPS_CONF : Path to the groups.conf file which contains information on mapping VOMS groups and roles to local groups. An example of this configuration file is given in /opt/lcg/yaim/examples/groups.conf.

GSSKLOG : yes or no, indicating whether the site provides an AFS authentication server which maps gsi credentials into Kerberos tokens .

GSSKLOG_SERVER : If GSSKLOG is yes, the name of the AFS authentication server host.

INSTALL_ROOT : Installation root - change if using the re-locatable distribution.

JAVA_LOCATION : Path to Java VM installation. It can be used in order to run a different version of java installed locally.

JOB_MANAGER : The name of the job manager used by the gatekeeper.

LFC_CENTRAL : A list of VOs for which the LFC should be configured as a central catalogue.

LFC_HOST : Set this if you are building an LFC_HOST, not if you're just using clients.

LFC_LOCAL : Normally the LFC will support all VOs in the VOS variable. If you want to limit this list, add the ones you need to LFC_LOCAL. For each item listed in the VOS variable you need to create a set of new variables as follows:

VO_<VO-NAME>_QUEUES : The queues that the VO can use on the CE.

VO_<VO-NAME>_SE : Default SE used by the VO. WARNING: VO-NAME must be in capital cases.

VO_<VO-NAME>_SGM : ldap directory with VO software managers list. WARNING: VO-NAME must be in capital cases.

VO_<VO-NAME>_STORAGE_DIR : Mount point on the Storage Element for the VO. WARNING: VO-NAME must be in capital cases.

VO_<VO-NAME>_SW_DIR : Area on the WN for the installation of the experiment software. If on the WNs a predefined shared area has been mounted where VO managers can pre-install software, then these variable should point to this area. If instead there is not a shared area and each job must install the software, then this variables should contain a dot (.).Anyway the mounting of shared areas, as well as the local installation of VO software is not managed by *yaim* and should be handled locally by Site Administrators. WARNING: VO-NAME must be in capital cases.

VO_<VO-NAME>_USERS : ldap directory with VO users list. WARNING: VO-NAME must be in capital cases.

VO_<VO-NAME>_VOMS_POOL_PATH : If necessary, append this to the VOMS_SERVER URL for the pool account list .

VO_<VO-NAME>_VOMS_SERVERS : A list of VOMS servers for the VO.

MON_HOST : MON Box Hostname.

MY_DOMAIN : site's domain name.

OUTPUT_STORAGE : Default Output directory for the jobs.

PX_HOST : PX hostname.

QUEUES : The name of the queues for the CE. These are by default set as the VO names.

RB_HOST : Resource Broker Hostname.

REG_HOST : RGMA Registry hostname.

SE_LIST : A list of hostnames of the SEs available at your site.

SITE_EMAIL : The e-mail address as published by the information system.

SITE_LAT : Site latitude.

SITE_LOC : "City, Country".

SITE_LONG : Site longitude.

SITE_NAME : Your GIIS.

SITE_SUPPORT_SITE : Support entry point ; Unique Id for the site in the GOC DB and information system.

SITE_TIER : Site tier.

SITE_WEB : Site site.

TORQUE_SERVER : Set this if your torque server is on a different host from the CE. It is ingored for other batch systems.

USERS_CONF : Path to the file containing a list of Linux users (pool accounts) to be created. This file should be created by the Site Administrator, which contains a plain list of the users and IDs. An example of this configuration file is given in /opt/lcg/yaim/examples/users.conf.

VOBOX_HOST : VOBOX hostname.

VOBOX_PORT : The port the VOBOX gsisshd listens on.

VOS : List of supported VOs.

VO_SW_DIR : Directory for installation of experiment software.

3. CONFIGURE LIBRARY PATHS

Author(s): Retico,Antonio
Email : support-lcg-manual-install@cern.ch

This chapter describes the configuration steps done by the *yaim* function '*config_ldconf*' .

In order to allow the middleware libraries to be looked up and dinamically linked, the relevant paths need to be configured.

- If not already there, append the following lines to the file */etc/ld.so.conf*

```
<INSTALL_ROOT>/globus/lib
<INSTALL_ROOT>/edg/lib
<INSTALL_ROOT>/lcg/lib
/usr/local/lib
/usr/kerberos/lib
/usr/X11R6/lib
/usr/lib/qt-3.1/lib
/opt/gcc-3.2.2/lib
```

  where <INSTALL_ROOT> is the installation root of the lcg middleware (*/opt* by default).

- Run the command:

```
> /sbin/ldconfig -v
```

  (this command produces a huge amount of output)

3.1. SPECIFICATION OF FUNCTION: CONFIG_LDCONF

The function '*config_ldconf*' needs the following variables to be set in the configuration file:

INSTALL_ROOT : Installation root - change if using the re-locatable distribution.

The original code of the function can be found in:

/opt/lcg/yaim/functions/config_ldconf

The code is reproduced also in 28.1..

---

4. SET-UP EDG CONFIGURATION VARIABLES

Author(s): Retico,Antonio
Email : support-lcg-manual-install@cern.ch

This chapter describes the configuration steps done by the *yaim* function '*config_sysconfig_edg*'.

The EDG configuration file is parsed by EDG daemons to locate the EDG root directory and various other global properties.

Create and edit the file */etc/sysconfig/edg* as follows:

```
EDG_LOCATION=<INSTALL_ROOT>/edg
EDG_LOCATION_VAR=<INSTALL_ROOT>/edg/var
EDG_TMP=/tmp
X509_USER_CERT=/etc/grid-security/hostcert.pem
X509_USER_KEY=/etc/grid-security/hostkey.pem
GRIDMAP=/etc/grid-security/grid-mapfile
GRIDMAPDIR=/etc/grid-security/gridmapdir/
```

where <INSTALL_ROOT> is the installation root of the lcg middleware (*/opt* by default).

NOTE: it might be observed that some of the variables above listed dealing with the GSI (Grid Security Interface) are needed just on service nodes (e.g. CE, RB) and not on others. Nevertheless, for sake of simplicity, *yaim* uses the same definitions on all node types, which has been proven not to hurt.

4.1. SPECIFICATION OF FUNCTION: CONFIG_SYSCONFIG_EDG

The function *'config_sysconfig_edg'* needs the following variables to be set in the configuration file:

INSTALL_ROOT : Installation root - change if using the re-locatable distribution.

The original code of the function can be found in:

```
/opt/lcg/yaim/functions/config_sysconfig_edg
```

The code is reproduced also in 28.2..

5. SET-UP GLOBUS CONFIGURATION VARIABLES

Author(s): Retico,Antonio
Email : support-lcg-manual-install@cern.ch

This chapter describes the configuration steps done by the *yaim* function '*config_sysconfig_globus*'.

Create and edit the file */etc/sysconfig/globus* as follows:

```
GLOBUS_LOCATION=<INSTALL_ROOT>/globus
GLOBUS_CONFIG=/etc/globus.conf
GLOBUS_TCP_PORT_RANGE="20000 25000"
export LANG=C
```

where <INSTALL_ROOT> is the installation root of the lcg middleware (*/opt* by default).

5.1. SPECIFICATION OF FUNCTION: CONFIG_SYSCONFIG_GLOBUS

The function '*config_sysconfig_globus*' needs the following variables to be set in the configuration file:

GLOBUS_TCP_PORT_RANGE : Port range for Globus IO.

INSTALL_ROOT : Installation root - change if using the re-locatable distribution.

The original code of the function can be found in:

```
/opt/lcg/yaim/functions/config_sysconfig_globus
```

The code is reproduced also in 28.3..

6. SET-UP LCG CONFIGURATION VARIABLES

Author(s): Retico,Antonio
Email : support-lcg-manual-install@cern.ch

This chapter describes the configuration steps done by the *yaim* function '*config_sysconfig_lcg*'.

Create and edit the file */etc/sysconfig/lcg* as follows:

```
LCG_LOCATION=<INSTALL_ROOT>/lcg
LCG_LOCATION_VAR=<INSTALL_ROOT>/lcg/var
LCG_TMP=/tmp
```

where <INSTALL_ROOT> is the installation root of the lcg middleware (*/opt* by default).

6.1. SPECIFICATION OF FUNCTION: CONFIG_SYSCONFIG_LCG

The function *'config_sysconfig_lcg'* needs the following variables to be set in the configuration file:

INSTALL_ROOT : Installation root - change if using the re-locatable distribution.

SITE_NAME : Your GIIS.

The original code of the function can be found in:

```
/opt/lcg/yaim/functions/config_sysconfig_lcg
```

The code is reproduced also in 28.4..

7. SET-UP UPDATING OF CRLS

Author(s): Vidic,Valentin
Email : support-lcg-manual-install@cern.ch

This chapter describes the configuration steps done by the *yaim* function '*config_crl*'.

Cron script is installed to fetch new versions of CRLs four times a day. The time when the script is run is randomized in order to distribute the load on CRL servers. If the configuration is run as root, the cron entry is installed in */etc/cron.d/edg-fetch-crl*, otherwise it is installed as a user cron entry.

CRLs are also updated immediately by running the update script (*<INSTALL_ROOT>/edg/etc/cron/edg-fetch-crl-cron*).

Logrotate script is installed as */etc/logrotate.d/edg-fetch-crl* to prevent the logs from growing indefinitely.

7.1. SPECIFICATION OF FUNCTION: CONFIG_CRL

The function *'config_crl'* needs the following variables to be set in the configuration file:

INSTALL_ROOT : Installation root - change if using the re-locatable distribution.

The original code of the function can be found in:

```
/opt/lcg/yaim/functions/config_crl
```

The code is reproduced also in 28.5..

8. SET-UP RFIO

Author(s): Vidic,Valentin
Email : support-lcg-manual-install@cern.ch

This chapter describes the configuration steps done by the *yaim* function '*config_rfio*'.

rfiod is configured on SE_classic nodes by adding the appropriate ports (5001 TCP and UDP) to */etc/services* and restarting the daemon.

For SE_dpm nodes, *rfiod* is configured by *config_DPM_rfio* so no configuration is done here.

All other nodes don't run *rfiod*. However, *rfiod* might still be installed from *CASTOR-client* RPM. If this is the case, we make sure it's stopped and disabled.

8.1. SPECIFICATION OF FUNCTION: CONFIG_RFIO

The function *'config_rfio'* needs the following variables to be set in the configuration file:

INSTALL_ROOT : Installation root - change if using the re-locatable distribution.

The original code of the function can be found in:

`/opt/lcg/yaim/functions/config_rfio`

The code is reproduced also in 28.6..

9. SET-UP HOST CERTIFICATES

Author(s): Retico,Antonio
Email : support-lcg-manual-install@cern.ch

This chapter describes the configuration steps done by the *yaim* function '*config_host_certs*'.

The VOBOX node requires the host certificate/key files to be put in place before you start the installation.

Contact your national Certification Authority (CA) to understand how to obtain a host certificate if you do not have one already.

Instruction to obtain a CA list can be found in

```
http://markusw.home.cern.ch/markusw/lcg2CAlist.html
```

From the CA list so obtained you should choose a CA close to you.

Once you have obtained a valid certificate, i.e. a file

hostcert.pem

containing the machine public key and a file

hostkey.pem

containing the machine private key, make sure to place the two files into the directory

/etc/grid-security

with the following permissions

```
> chmod 400 /etc/grid-security/hostkey.pem
```

```
> chmod 644 /etc/grid-security/hostcert.pem
```

It is IMPORTANT that permissions be set as shown, as otherwise certification errors will occur.

If the certificates don't exist, the function exits with an error message and the calling process is interrupted.

9.1. SPECIFICATION OF FUNCTION: CONFIG_HOST_CERTS

The function *'config_host_certs'* needs the following variables to be set in the configuration file:

The original code of the function can be found in:

`/opt/lcg/yaim/functions/config_host_certs`

The code is reproduced also in 28.7..

10. CREATE POOL ACCOUNTS

Author(s): Vidic,Valentin
Email : support-lcg-manual-install@cern.ch

This chapter describes the configuration steps done by the *yaim* function '*config_users*'.

config_users creates pool accounts for grid users defined in *users.conf*. Each line in this file describes one user:

```
UID:LOGIN:GID:GROUP:VO:SGM_FLAG:
```

First, the format of the *users.conf* file is checked (VO and SGM fields were added recently).

Groups are then created for the supported VOs (listed in *<VOS>* variable) using *groupadd*.

For each of the lines in *users.conf*, a user account is created (with *useradd*) if that user's VO is supported.

Finally, grid users are denied access to *cron* and *at* by adding their usernames to */etc/at.deny* and */etc/cron.deny*.

10.1. SPECIFICATION OF FUNCTION: CONFIG_USERS

The function *'config_users'* needs the following variables to be set in the configuration file:

INSTALL_ROOT : Installation root - change if using the re-locatable distribution.

USERS_CONF : Path to the file containing a list of Linux users (pool accounts) to be created. This file should be created by the Site Administrator, which contains a plain list of the users and IDs. An example of this configuration file is given in /opt/lcg/yaim/examples/users.conf.

VOS : List of supported VOs.

The original code of the function can be found in:

```
/opt/lcg/yaim/functions/config_users
```

The code is reproduced also in 28.8..

11. CREATE EDG USERS

Author(s): Retico,Antonio
Email : support-lcg-manual-install@cern.ch

This chapter describes the configuration steps done by the *yaim* function '*config_edgusers*'.

Many of the services running on LCG service nodes are owned by the user *edguser*. The user edguser belongs to the group *edguser* and it has got a home directory in */home*.

The user *edginfo* is required on all the nodes publishing information on the Information System. The user belongs to the group *edginfo* and it has got a home directory in */home*.

No special requirements exists for the ID of the above mentioned users and groups.

The function creates both*edguser* and *edginfo* groups and users.

- group *edguser*: the group is created with group ID 995.

- user *edguser*: the user is created with group ID 995 and its home is */home/edguser*.

- group *edginfo*: the group is created with group ID 999.

- user *edginfo*: the user is created with group ID 999 and its home is */home/edguser*.

11.1. SPECIFICATION OF FUNCTION: CONFIG_EDGUSERS

The function *'config_edgusers'* needs the following variables to be set in the configuration file:

INSTALL_ROOT : Installation root - change if using the re-locatable distribution.

USERS_CONF : Path to the file containing a list of Linux users (pool accounts) to be created. This file should be created by the Site Administrator, which contains a plain list of the users and IDs. An example of this configuration file is given in /opt/lcg/yaim/examples/users.conf.

VOS : List of supported VOs.

The original code of the function can be found in:

```
/opt/lcg/yaim/functions/config_edgusers
```

The code is reproduced also in 28.9..

12. SET-UP POOL ACCOUNT MAPPINGS

Author(s): Vidic,Valentin
Email : support-lcg-manual-install@cern.ch

This chapter describes the configuration steps done by the *yaim* function '*config_mkgridmap*'.

Format of the *users.conf* file is checked first. This file should have six colon separated fields. Using this file, */etc/grid-security/gridmapdir* pool directory is created and initialized with pool accounts.

Next, configuration for *edg-mkgridmap* is generated in *<INSTALL_ROOT>/edg/etc/edg-mkgridmap.conf*. *edg-mkgridmap* generates */etc/grid-security/grid-mapfile* using VO membership information in VOMS and/or LDAP. The following lines are generated for each of the supported VOs:

```
group <VO_<vo>_SERVER>/Role=lcgadmin sgmuser
group <VO_<vo>_SERVER>/<VO_<vo>_VOMS_EXTRA_MAPS>
group <VO_<vo>_SERVER><VO_<vo>_VOMS_POOL_PATH> .user_prefix

group <VO_<vo>_SGM> sgmuser
group <VO_<vo>_USERS> .user_prefix
```

where *sgmuser* is SGM for the <vo> and *user_prefix* is the prefix for <vo> pool accounts (both values are inferred from *users.conf*). Multiple VOMS servers and extra maps can be defined.

Authentication URLs and site specific mappings are appended to the end of the file:

```
auth <GRIDMAP_AUTH>

gmf_local <INSTALL_ROOT>/edg/etc/grid-mapfile-local
```

If authentication URLs are not defined in <GRIDMAP_AUTH>, *ldap://lcg-registrar.cern.ch/ou=users,o=registrar,dc* is used.

Site specific grid user mappings can be defined in <INSTALL_ROOT>/edg/etc/grid-mapfile-local. Contents of this file are included verbatim in the output of *edg-mkgridmap*.

<INSTALL_ROOT>/edg/etc/lcmaps/gridmapfile is generated with the following contents for each supported VO:

```
/VO=<vo>/GROUP=/<vo>/ROLE=lcgadmin sgmuser
/VO=<vo>/GROUP=/<vo> .user_prefix
```

This file defines local account mappings for VOMS enabled proxy certificates.

<INSTALL_ROOT>/edg/etc/lcmaps/groupmapfile is generated with the following contents for each supported VO:

```
/VO=<vo>/GROUP=/<vo>/ROLE=lcgadmin vo_group
/VO=<vo>/GROUP=/<vo> vo_group
```

This file defines local group mappings for VOMS enabled proxy certificates.

After the configuration is finished, *edg-mkgridmap* is run with the new configuration to generate the */etc/grid-security/grid-mapfile*. Cron job for regenerating *grid-mapfile* is installed to run four times a day.

A cron job for expiring gridmapdir pool accounts is installed to run once a day on all nodes except nodes running *dpm*. This is a temporary fix to avoid users losing access to their files after the mapping expires and they are mapped to a different local user. By default, pool accounts expire if they are not used for more than 2 days, except on RB where they are expired after 10 days.

12.1. SPECIFICATION OF FUNCTION: CONFIG_MKGRIDMAP

The function *'config_mkgridmap'* needs the following variables to be set in the configuration file:

CRON_DIR : Yaim writes all cron jobs to this directory. Change it if you want to turn off Yaim's management of cron.

GRIDMAP_AUTH : List of ldap servers in edg-mkgridmap.conf which authenticate users.

GROUPS_CONF : Path to the groups.conf file which contains information on mapping VOMS groups and roles to local groups. An example of this configuration file is given in /opt/lcg/yaim/examples/groups.conf.

INSTALL_ROOT : Installation root - change if using the re-locatable distribution.

USERS_CONF : Path to the file containing a list of Linux users (pool accounts) to be created. This file should be created by the Site Administrator, which contains a plain list of the users and IDs. An example of this configuration file is given in /opt/lcg/yaim/examples/users.conf.

VOS : List of supported VOs. For each item listed in the VOS variable you need to create a set of new variables as follows:

VO_<VO-NAME>_SGM : ldap directory with VO software managers list. WARNING: VO-NAME must be in capital cases.

VO_<VO-NAME>_USERS : ldap directory with VO users list. WARNING: VO-NAME must be in capital cases.

VO_<VO-NAME>_VOMS_POOL_PATH : If necessary, append this to the VOMS_SERVER URL for the pool account list .

VO_<VO-NAME>_VOMS_SERVERS : A list of VOMS servers for the VO.

The original code of the function can be found in:

```
/opt/lcg/yaim/functions/config_mkgridmap
```

The code is reproduced also in 28.10..

13. SET-UP JAVA LOCATION

Author(s): Vidic,Valentin
Email : support-lcg-manual-install@cern.ch

This chapter describes the configuration steps done by the *yaim* function '*config_java*'.

Since Java is not included in the LCG distribution, Java location needs to be configured with yaim.

If <JAVA_LOCATION> is not defined in *site-info.def*, it is determined from installed Java RPMs (if available).

In relocatable distribution, JAVA_HOME environment variable is defined in *<INSTALL_ROOT>/etc/profile.d/grid_en* and *<INSTALL_ROOT>/etc/profile.d/grid_env.csh*.

Otherwise, JAVA_HOME is defined in */etc/java/java.conf* and */etc/java.conf* and Java binaries added to PATH in *<INSTALL_ROOT>/edg/etc/profile.d/j2.sh* and *<INSTALL_ROOT>/edg/etc/profile.d/j2.csh*.

13.1. SPECIFICATION OF FUNCTION: CONFIG_JAVA

The function *'config_java'* needs the following variables to be set in the configuration file:

INSTALL_ROOT : Installation root - change if using the re-locatable distribution.

JAVA_LOCATION : Path to Java VM installation. It can be used in order to run a different version of java installed locally.

The original code of the function can be found in:

```
/opt/lcg/yaim/functions/config_java
```

The code is reproduced also in 28.11..

14. SET-UP R-GMA CLIENT

Author(s): Vidic,Valentin
Email : support-lcg-manual-install@cern.ch

This chapter describes the configuration steps done by the *yaim* function '*config_rgma_client*'.

R-GMA client configuration is generated in *<INSTALL_ROOT>/glite/etc/rgma/rgma.conf* by running:

```
<INSTALL_ROOT>/glite/share/rgma/scripts/rgma-setup.py --secure=no --server=<MON_HOST> --registry=<REG_HOST> --schem
```

<INSTALL_ROOT>/edg/etc/profile.d/edg-rgma-env.sh and *<INSTALL_ROOT>/edg/etc/profile.d/edg-rgma-env.csh* with the following functionality:

- RGME_HOME is set to *<INSTALL_ROOT>/glite*

- APEL_HOME is set to *<INSTALL_ROOT>/glite*

- *<INSTALL_ROOT>/glite/lib/python* is added to PYTHONPATH

- *<INSTALL_ROOT>/glite/lib* is added to LD_LIBRARY_PATH.

These files are sourced into the users environment from *<INSTALL_ROOT>/etc/profile.d/z_edg_profile.sh* and *<INSTALL_ROOT>/etc/profile.d/z_edg_profile.csh*.

14.1. SPECIFICATION OF FUNCTION: CONFIG_RGMA_CLIENT

The function '*config_rgma_client*' needs the following variables to be set in the configuration file:

INSTALL_ROOT : Installation root - change if using the re-locatable distribution.

MON_HOST : MON Box Hostname.

REG_HOST : RGMA Registry hostname.

The original code of the function can be found in:

```
/opt/lcg/yaim/functions/config_rgma_client
```

The code is also reproduced in 28.12..

15.   SET-UP GENERIC INFORMATION PROVIDER

Author(s): Vidic,Valentin
Email : support-lcg-manual-install@cern.ch

This chapter describes the configuration steps done by the *yaim* function '*config_gip*'.

Generic Information Provider (GIP) is configured through *<INSTALL_ROOT>/lcg/var/gip/lcg-info-generic.conf*. The start of this file is common for all types of nodes:

```
ldif_file=<INSTALL_ROOT>/lcg/var/gip/lcg-info-static.ldif
generic_script=<INSTALL_ROOT>/lcg/libexec/lcg-info-generic
wrapper_script=<INSTALL_ROOT>/lcg/libexec/lcg-info-wrapper
temp_path=<INSTALL_ROOT>/lcg/var/gip/tmp
template=<INSTALL_ROOT>/lcg/etc/GlueSite.template
template=<INSTALL_ROOT>/lcg/etc/GlueCE.template
template=<INSTALL_ROOT>/lcg/etc/GlueCESEBind.template
template=<INSTALL_ROOT>/lcg/etc/GlueSE.template
template=<INSTALL_ROOT>/lcg/etc/GlueService.template

# Common for all
GlueInformationServiceURL: ldap://<hostname>:2135/mds-vo-name=local,o=grid
```

<hostname> is determined by running *hostname -f*.

For CE the following is added:

```
dn: GlueSiteUniqueID=<SITE_NAME>,mds-vo-name=local,o=grid
GlueSiteName: <SITE_NAME>
GlueSiteDescription: LCG Site
GlueSiteUserSupportContact: mailto: <SITE_EMAIL>
GlueSiteSysAdminContact: mailto: <SITE_EMAIL>
GlueSiteSecurityContact: mailto: <SITE_EMAIL>
GlueSiteLocation: <SITE_LOC>
GlueSiteLatitude: <SITE_LAT>
GlueSiteLongitude: <SITE_LONG>
GlueSiteWeb: <SITE_WEB>
GlueSiteOtherInfo: <SITE_TIER>
GlueSiteOtherInfo: <SITE_SUPPORT_SITE>
GlueForeignKey: GlueSiteUniqueID=<SITE_NAME>
GlueForeignKey: GlueClusterUniqueID=<CE_HOST>
GlueForeignKey: GlueSEUniqueID=<SE_HOST>

dynamic_script=<INSTALL_ROOT>/lcg/libexec/lcg-info-dynamic-ce
dynamic_script=<INSTALL_ROOT>/lcg/libexec/lcg-info-dynamic-software <INSTALL_ROOT>/lcg/var/gip/lcg-info-generic.con

# CE Information Provider
GlueCEHostingCluster: <CE_HOST>
GlueCEInfoGatekeeperPort: 2119
GlueCEInfoHostName: <CE_HOST>
GlueCEInfoLRMSType: <CE_BATCH_SYS>

GlueCESEBindCEAccesspoint: <accesspoint>
GlueCESEBindCEUniqueID: <CE_HOST>:2119/jobmanager-<JOB_MANAGER>-<queue>
```

where *<accesspoint>* is:

- *<DPMDATA>* for DPM SE

- */storage* for dCache

- *<CLASSIC_STORAGE_DIR>* for SE classic.

Some lines can be generated multiple times for different *<vo>*s, *<queue>*s, *<se>*s etc.

For each of the supported VOs, a directory is created in *<INSTALL_ROOT>/edg/var/info/<vo>*. These are used by SGMs to publish information on experiment software installed on the cluster.

For the nodes running GridICE server (usually SE) the following is added:

```
dn: GlueServiceUniqueID=<GRIDICE_SERVER_HOST>:2136,Mds-vo-name=local,o=grid
GlueServiceName: <SITE_NAME>-gridice
GlueServiceType: gridice
GlueServiceVersion: 1.1.0
GlueServiceEndpoint: ldap://<GRIDICE_SERVER_HOST>:2136/mds-vo-name=local,o=grid
GlueServiceStatus: OK
GlueServiceStatusInfo: No Problems
GlueServiceStartTime: 2002-10-09T19:00:00Z
GlueServiceOwner: LCG
GlueForeignKey: GlueSiteUniqueID=<SITE_NAME>
GlueServiceAccessControlRule:<vo>
```

For PX nodes the following is added:

```
dn: GlueServiceUniqueID=<PX_HOST>:7512,Mds-vo-name=local,o=grid
GlueServiceName: <SITE_NAME>-myproxy
GlueServiceType: myproxy
GlueServiceVersion: 1.1.0
GlueServiceEndpoint: <PX_HOST>:7512
GlueServiceStatus: OK
GlueServiceStatusInfo: No Problems

GlueServiceDataKey: Jobs
GlueServiceDataValue: 0
GlueChunkKey: GlueServiceUniqueID=gram://<RB_HOST>:7772

dn: GlueServiceDataKey=LogMonitor,GlueServiceUniqueID=gram://<RB_HOST>:7772,Mds-vo-name=local,o=grid
GlueServiceDataKey: LogMonitor
GlueServiceDataValue: 0
GlueChunkKey: GlueServiceUniqueID=gram://<RB_HOST>:7772

dn: GlueServiceDataKey=RunningJobs,GlueServiceUniqueID=gram://<RB_HOST>:7772,Mds-vo-name=local,o=grid
GlueServiceDataKey: RunningJobs
GlueServiceDataValue: 14
GlueChunkKey: GlueServiceUniqueID=gram://<RB_HOST>:7772

dn: GlueServiceDataKey=WorkloadManager,GlueServiceUniqueID=gram://<RB_HOST>:7772,Mds-vo-name=local,o=grid
GlueServiceDataKey: WorkloadManager
GlueServiceDataValue: 0
GlueChunkKey: GlueServiceUniqueID=gram://<RB_HOST>:7772
```

For central LFC the following is added:

```
dn: GlueServiceUniqueID=http://<LFC_HOST>:8085/,mds-vo-name=local,o=grid
GlueServiceName: <SITE_NAME>-lfc-dli
GlueServiceType: data-location-interface
GlueServiceVersion: 1.0.0
GlueServiceEndpoint: http://<LFC_HOST>:8085/
GlueServiceURI: http://<LFC_HOST}:8085/
```

```
GlueServiceAccessPointURL: http://<LFC_HOST>:8085/
GlueServiceStatus: running
GlueForeignKey: GlueSiteUniqueID=<SITE_NAME>
GlueServiceOwner: <vo>
GlueServiceAccessControlRule: <vo>

dn: GlueServiceUniqueID=<LFC_HOST>,mds-vo-name=local,o=grid
GlueServiceName: <SITE_NAME>-lfc
GlueServiceType: lcg-file-catalog
GlueServiceVersion: 1.0.0
GlueServiceEndpoint: <LFC_HOST>
GlueServiceURI: <LFC_HOST>
GlueServiceAccessPointURL: <LFC_HOST>
GlueServiceStatus: running
GlueForeignKey: GlueSiteUniqueID=<SITE_NAME>
GlueServiceOwner: <vo>
GlueServiceAccessControlRule: <vo>
```

For local LFC the following is added:

```
dn: GlueServiceUniqueID=<LFC_HOST>,mds-vo-name=local,o=grid
GlueServiceName: <SITE_NAME>-lfc
GlueServiceType: lcg-local-file-catalog
GlueServiceVersion: 1.0.0
GlueServiceEndpoint: <LFC_HOST>
GlueServiceURI: <LFC_HOST>
GlueServiceAccessPointURL: <LFC_HOST>
GlueServiceStatus: running
GlueForeignKey: GlueSiteUniqueID=<SITE_NAME>
GlueServiceOwner: <vo>
GlueServiceAccessControlRule: <vo>
```

For dcache and dpm nodes the following is added:

```
dn: GlueServiceUniqueID=httpg://<SE_HOST>:8443/srm/managerv1,Mds-Vo-name=local,o=grid
GlueServiceAccessPointURL: httpg://<SE_HOST>:8443/srm/managerv1
GlueServiceEndpoint: httpg://<SE_HOST>:8443/srm/managerv1
GlueServiceType: srm_v1
GlueServiceURI: httpg://<SE_HOST>:8443/srm/managerv1
GlueServicePrimaryOwnerName: LCG
GlueServicePrimaryOwnerContact: mailto:<SITE_EMAIL>
GlueForeignKey: GlueSiteUniqueID=<SITE_NAME>
GlueServiceVersion: 1.0.0
GlueServiceAccessControlRule: <vo>
GlueServiceInformationServiceURL: MDS2GRIS:ldap://<BDII_HOST>:2170/mds-voname=local,mds-vo-name=<SITE_NAME>,mds-vo-
GlueServiceStatus: running
```

For all types of SE the following is added:

```
dynamic_script=<INSTALL_ROOT>/lcg/libexec/lcg-info-dynamic-se

GlueSEType: <se_type>
GlueSEPort: 2811
GlueSESizeTotal: 0
GlueSESizeFree: 0
```

```
GlueSEArchitecture: <se_type>
GlueSAType: permanent
GlueSAPolicyFileLifeTime: permanent
GlueSAPolicyMaxFileSize: 10000
GlueSAPolicyMinFileSize: 1
GlueSAPolicyMaxData: 100
GlueSAPolicyMaxNumFiles: 10
GlueSAPolicyMaxPinDuration: 10
GlueSAPolicyQuota: 0
GlueSAStateAvailableSpace: 1
GlueSAStateUsedSpace: 1

dn: GlueSEUniqueID=<SE_HOST>,mds-vo-name=local,o=grid
GlueSEName: <SITE_NAME>:<se_type>
GlueForeignKey: GlueSiteUniqueID=<SITE_NAME>

dn: GlueSEAccessProtocolLocalID=gsiftp, GlueSEUniqueID=<SE_HOST>,Mds-Vo-name=local,o=grid
GlueSEAccessProtocolType: gsiftp
GlueSEAccessProtocolPort: 2811
GlueSEAccessProtocolVersion: 1.0.0
GlueSEAccessProtocolSupportedSecurity: GSI
GlueChunkKey: GlueSEUniqueID=<SE_HOST>

dn: GlueSEAccessProtocolLocalID=rfio, GlueSEUniqueID=<SE_HOST>,Mds-Vo-name=local,o=grid
GlueSEAccessProtocolType: rfio
GlueSEAccessProtocolPort: 5001
GlueSEAccessProtocolVersion: 1.0.0
GlueSEAccessProtocolSupportedSecurity: RFIO
GlueChunkKey: GlueSEUniqueID=<SE_HOST>
```

where *<se_type>* is *srm_v1* for DPM and dCache and *disk* otherwise.

For SE_dpm the following is added:

```
dn: GlueSALocalID=<vo>,GlueSEUniqueID=<SE_HOST>,Mds-Vo-name=local,o=grid
GlueSARoot: <vo>:/dpm/<domain>/home/<vo>
GlueSAPath: <vo>:/dpm/<domain>/home/<vo>
GlueSAAccessControlBaseRule: <vo>
GlueChunkKey: GlueSEUniqueID=<SE_HOST>
```

For SE_dcache the following is added:

```
dn: GlueSALocalID=<vo>,GlueSEUniqueID=<SE_HOST>,Mds-Vo-name=local,o=grid
GlueSARoot: <vo>:/pnfs/<domain>/home/<vo>
GlueSAPath: <vo>:/pnfs/<domain>/home/<vo>
GlueSAAccessControlBaseRule: <vo>
GlueChunkKey: GlueSEUniqueID=<SE_HOST>
```

For other types of SE the following is used:

```
dn: GlueSALocalID=<vo>,GlueSEUniqueID=<SE_HOST>,Mds-Vo-name=local,o=grid
GlueSARoot: <vo>:<vo>
GlueSAPath: <VO_<vo>_STORAGE_DIR>
GlueSAAccessControlBaseRule: <vo>
GlueChunkKey: GlueSEUniqueID=<SE_HOST>
```

For VOBOX the following is added:

```
dn: GlueServiceUniqueID=gsissh://<VOBOX_HOST>:<VOBOX_PORT>,Mds-vo-name=local,o=grid
GlueServiceAccessPointURL: gsissh://<VOBOX_HOST>:<VOBOX_PORT>
GlueServiceName: <SITE_NAME>-vobox
GlueServiceType: VOBOX
GlueServiceEndpoint: gsissh://<VOBOX_HOST>:<VOBOX_PORT>
GlueServicePrimaryOwnerName: LCG
GlueServicePrimaryOwnerContact: <SITE_EMAIL>
GlueForeignKey: GlueSiteUniqueID=<SITE_NAME>
GlueServiceVersion: 1.0.0
GlueServiceInformationServiceURL: ldap://<VOBOX_HOST>:2135/mds-vo-name=local,o=grid
GlueServiceStatus: running
GlueServiceAccessControlRule: <vo>
```

Configuration script is run:

```
<INSTALL_ROOT>/lcg/sbin/lcg-info-generic-config <INSTALL_ROOT>/lcg/var/gip/lcg-info-generic.conf
```

Configuration script generates a ldif file (*<INSTALL_ROOT>/lcg/var/gip/lcg-info-static.ldif*) by merging templates from *<INSTALL_ROOT>/lcg/etc/* and data from *<INSTALL_ROOT>/lcg/var/gip/lcg-info-generic.conf*. Wrapper script is also created in *<INSTALL_ROOT>/lcg/libexec/lcg-info-wrapper*.

<INSTALL_ROOT>/globus/libexec/edg.info is created:

```
#!/bin/bash
#
# info-globus-ldif.sh
#
#Configures information providers for MDS
#
cat << EOF

dn: Mds-Vo-name=local,o=grid
objectclass: GlobusTop
objectclass: GlobusActiveObject
objectclass: GlobusActiveSearch
type: exec
path: <INSTALL_ROOT>/lcg/libexec
base: lcg-info-wrapper
args:
cachetime: 60
timelimit: 20
sizelimit: 250

EOF
```

<INSTALL_ROOT>/globus/libexec/edg.info is created:

```
#!/bin/bash

cat <<EOF
<INSTALL_ROOT>/globus/etc/openldap/schema/core.schema
<INSTALL_ROOT>/glue/schema/ldap/Glue-CORE.schema
<INSTALL_ROOT>/glue/schema/ldap/Glue-CE.schema
```

```
<INSTALL_ROOT>/glue/schema/ldap/Glue-CESEBind.schema
<INSTALL_ROOT>/glue/schema/ldap/Glue-SE.schema
EOF
```

These two scripts are used to generate *slapd* configuration for Globus MDS.

<INSTALL_ROOT>/lcg/libexec/lcg-info-dynamic-ce is generated to call the information provider appropriate for the LRMS. For Torque the file has these contents:

```
#!/bin/sh
<INSTALL_ROOT>/lcg/libexec/lcg-info-dynamic-pbs <INSTALL_ROOT>/lcg/var/gip/lcg-info-generic.conf <TORQUE_SERVER>
```

R-GMA GIN periodically queries MDS and inserts the data into R-GMA. GIN is configured on all nodes except UI and WN by copying host certificate to *<INSTALL_ROOT>/glite/var/rgma/.certs* and updating the configuration file appropriately (*<INSTALL_ROOT>/glite/etc/rgma/ClientAuthentication.props*). Finally, GIN configuration script (*<INSTALL_ROOT>/glite/bin/rgma-gin-config*) is run to configure the mapping between Glue schema in MDS and Glue tables in R-GMA. *rgma-gin* service is restarted and configured to start on boot.

15.1. SPECIFICATION OF FUNCTION: CONFIG_GIP

The function *'config_gip'* needs the following variables to be set in the configuration file:

BDII_HOST : BDII Hostname.

CE_BATCH_SYS : Implementation of site batch system. Available values are "torque", "lsf", "pbs", "condor" etc.

CE_CPU_MODEL : Model of the CPU used by the WN (WN specification). This parameter is a string whose domain is not defined yet in the GLUE Schema. The value used for Pentium III is "PIII".

CE_CPU_SPEED : Clock frequency in Mhz (WN specification).

CE_CPU_VENDOR : Vendor of the CPU. used by the WN (WN specification). This parameter is a string whose domain is not defined yet in the GLUE Schema. The value used for Intel is "intel".

CE_HOST : Computing Element Hostname.

CE_INBOUNDIP : TRUE if inbound connectivity is enabled at your site, FALSE otherwise (WN specification).

CE_MINPHYSMEM : RAM size in kblocks (WN specification).

CE_MINVIRTMEM : Virtual Memory size in kblocks (WN specification).

CE_OS : Operating System name (WN specification).

CE_OS_RELEASE : Operating System release (WN specification).

CE_OUTBOUNDIP : TRUE if outbound connectivity is enabled at your site, FALSE otherwise (WN specification).

CE_RUNTIMEENV : List of software tags supported by the site. The list can include VO-specific software tags. In order to assure backward compatibility it should include the entry 'LCG-2', the current middleware version and the list of previous middleware tags.

CE_SF00 : Performance index of your fabric in SpecFloat 2000 (WN specification). For some examples of Spec values see http://www.specbench.org/osg/cpu2000/results/cint2000.html.

CE_SI00 : Performance index of your fabric in SpecInt 2000 (WN specification). For some examples of Spec values see http://www.specbench.org/osg/cpu2000/results/cint2000.html.

CE_SMPSIZE : Number of cpus in an SMP box (WN specification).

CLASSIC_HOST : The name of your SE_classic host.

CLASSIC_STORAGE_DIR : The root storage directory on CLASSIC_HOST.

DCACHE_ADMIN : Host name of the server node which manages the pool of nodes.

DPMDATA : Directory where the data is stored (absolute path, e.g./storage).

DPM_HOST : Host name of the DPM host, used also as a default DPM for the lcg-stdout-mon .

GRIDICE_SERVER_HOST : GridIce server host name (usually run on the MON node).

GRID_TRUSTED_BROKERS : List of the DNs of the Resource Brokers host certificates which are trusted by the Proxy node (ex: /O=Grid/O=CERN/OU=cern.ch/CN=host/testbed013.cern.ch).

INSTALL_ROOT : Installation root - change if using the re-locatable distribution.

JOB_MANAGER : The name of the job manager used by the gatekeeper.

LFC_CENTRAL : A list of VOs for which the LFC should be configured as a central catalogue.

LFC_HOST : Set this if you are building an LFC_HOST, not if you're just using clients.

LFC_LOCAL : Normally the LFC will support all VOs in the VOS variable. If you want to limit this list, add the ones you need to LFC_LOCAL. For each item listed in the VOS variable you need to create a set of new variables as follows:

> **VO_<VO-NAME>_QUEUES :** The queues that the VO can use on the CE.
>
> **VO_<VO-NAME>_SE :** Default SE used by the VO. WARNING: VO-NAME must be in capital cases.
>
> **VO_<VO-NAME>_STORAGE_DIR :** Mount point on the Storage Element for the VO. WARNING: VO-NAME must be in capital cases.
>
> **VO_<VO-NAME>_SW_DIR :** Area on the WN for the installation of the experiment software. If on the WNs a predefined shared area has been mounted where VO managers can pre-install software, then these variable should point to this area. If instead there is not a shared area and each job must install the software, then this variables should contain a dot (.).Anyway the mounting of shared areas, as well as the local installation of VO software is not managed by

yaim and should be handled locally by Site Administrators. WARNING: VO-NAME must be in capital cases.

PX_HOST : PX hostname.

QUEUES : The name of the queues for the CE. These are by default set as the VO names.

RB_HOST : Resource Broker Hostname.

SE_LIST : A list of hostnames of the SEs available at your site.

SITE_EMAIL : The e-mail address as published by the information system.

SITE_LAT : Site latitude.

SITE_LOC : "City, Country".

SITE_LONG : Site longitude.

SITE_NAME : Your GIIS.

SITE_SUPPORT_SITE : Support entry point ; Unique Id for the site in the GOC DB and information system.

SITE_TIER : Site tier.

SITE_WEB : Site site.

TORQUE_SERVER : Set this if your torque server is on a different host from the CE. It is ingored for other batch systems.

VOBOX_HOST : VOBOX hostname.

VOBOX_PORT : The port the VOBOX gsisshd listens on.

VOS : List of supported VOs.

VO_SW_DIR : Directory for installation of experiment software.

The original code of the function can be found in:

```
/opt/lcg/yaim/functions/config_gip
```

The code is also reproduced in 28.13..

16. SET-UP GLOBUS DAEMONS

Author(s): Vidic,Valentin
Email : support-lcg-manual-install@cern.ch

This chapter describes the configuration steps done by the *yaim* function '*config_globus*'.

The Globus configuration file */etc/globus.conf* is parsed by Globus daemon startup scripts to locate the Globus root directory and other global/daemon specific properties. The contents of the configuration file depend on the type of the node. The following table contains information on daemon to node mapping:

node/daemon	MDS	GridFTP	Gatekeeper
CE	yes	yes	yes
VOBOX	yes	yes	yes
SE_*	yes	yes	no
SE_dpm	yes	no	no
PX	yes	no	no
RB	yes	no	no
LFC	yes	no	no
GridICE	yes	no	no

Note that SE_dpm does not run standard GridFTP server, but a specialized DPM version.

The configuration file is divided into sections:

common Defines Globus installation directory, host certificates, location of gridmap file etc.

mds Defines information providers.

gridftp Defines the location of the GridFTP log file.

gatekeeper Defines jobmanagers and their parameters.

Logrotate scripts *globus-gatekeeper* and *gridftp* are installed in */etc/logrotate.d/*.

Globus initialization script (*<INSTALL_DIR>/globus/sbin/globus-initialization.sh*) is run next.

Finally, the appropriate daemons (*globus-mds*, *globus-gatekeeper*, *globus-gridftp*, *lcg-mon-gridftp*) are started (and configured to start on boot).

16.1. SPECIFICATION OF FUNCTION: CONFIG_GLOBUS

The function *'config_globus'* needs the following variables to be set in the configuration file:

CE_HOST : Computing Element Hostname.

GRIDICE_SERVER_HOST : GridIce server host name (usually run on the MON node).

INSTALL_ROOT : Installation root - change if using the re-locatable distribution.

JOB_MANAGER : The name of the job manager used by the gatekeeper.

PX_HOST : PX hostname.

RB_HOST : Resource Broker Hostname.

SITE_NAME : Your GIIS.

The original code of the function can be found in:

```
/opt/lcg/yaim/functions/config_globus
```

The code is reproduced also in 28.14..

17. SET-UP GRIDICE AGENT

Author(s): Retico,Antonio
Email : support-lcg-manual-install@cern.ch

This chapter describes the configuration steps done by the *yaim* function '*config_fmon_client*'.

The LCG nodes can produce data for the GridICE monitoring system.
The data are then sent to a collector server node which will then be queried by the LCG central GridICE monitoring service.

If you are running agents on the nodes (data producers), you should also run a GridICE collector server to collect information from your agents.

In the default LCG-2 configuration the MON node runs the GridICE collector node.

Before going forward with configuration, please assure the following RPMs to be installed (they should have been distributed with the node RPMs).

edg-fabricMonitoring
edt_sensor

In order to enable GridICE agent on a LCG node:

- Create and configure the file */opt/edg/var/etc/edg-fmon-agent.conf* as follows:

```
# Sensor file for edg-fmonagent
MSA

Transport

UDP

WARNING: be very careful not to use <SPACE> characters to indent lines in this configuration file. Use <TAB> (or nothing) instead. The edg-fmon-agent does not allow spaces at the beginning of a row in the configuration file.

The parameter **<GRIDICE_SERVER_HOST>** is the complete hostname of the node that runs the GridICE collector server and publishes the data on the information system. The collector node will have to run a plain GRIS for this.

The information is sent to the collector node via UDP (port 12409).

- start the GridICE agent

```
> chkconfig edg-fmon-agent on
> service edg-fmon-agent stop
> service edg-fmon-agent start
```

17.1. SPECIFICATION OF FUNCTION: CONFIG_FMON_CLIENT

The function *'config_fmon_client'* needs the following variables to be set in the configuration file:

BATCH_LOG_DIR : Your batch system log directory.

CE_BATCH_SYS : Implementation of site batch system. Available values are "torque", "lsf", "pbs", "condor" etc.

CE_HOST : Computing Element Hostname.

CRON_DIR : Yaim writes all cron jobs to this directory. Change it if you want to turn off Yaim's management of cron.

GRIDICE_SERVER_HOST : GridIce server host name (usually run on the MON node).

INSTALL_ROOT : Installation root - change if using the re-locatable distribution.

MON_HOST : MON Box Hostname.

MY_DOMAIN : site's domain name.

The original code of the function can be found in:

```
/opt/lcg/yaim/functions/config_fmon_client
```

The code is also reproduced in 28.15..

18. SET-UP LCG ENVIRONMENT VARIABLES

Author(s): Retico,Antonio
Email : support-lcg-manual-install@cern.ch

This chapter describes the configuration steps done by the *yaim* function '*config_lcgenv*'.

The LCG middleware needs some environment variables to be set up at boot time. The variable should be available both in 'bash-like' shells and in 'csh-like' shells.

This can be obtained in different ways:

The simplest way, if you have 'root' permissions, is to put a shell script for each of the supported shell 'families' in the directory */etc/profile.d*. The script will be automatically sourced at start up.

If instead you are not a superuser and you are doing the installation in a private directory (e.g. you are installing a Re-locatable Distribution of a Worker Node or a User Interface in the *<INSTALL_ROOT>* directory), you could create the scripts in the directory *<INSTALL_ROOT>/etc/profile.d*, in order to have the variables automatically set up by LCG tools.

The list of the environment variables to be set up follows:

LCG_GFAL_INFOSYS: Hostname of the BDII node.

MYPROXY_SERVER: Hostname of the Proxy server.

PATH: Add to the PATH variable the path */opt/d-cache-client/bin*

LD_LIBRARY_PATH: Add to the LD_LIBRARY_PATH variable the path */opt/d-cache-client/dcap*

SRM_PATH: Installation directory of the srm client. The default value for this variable is */opt/d-cache-client/srm*

VO_<VO-NAME>_SW_DIR: For each virtual organization <VO-NAME> An environment variable VO_<VO-NAME>_SW_DIR is needed. This variable points to the installation directory of the VO software.

VO_<VO-NAME>_DEFAULT_SE: For each virtual organization <VO-NAME> An environment variable VO_<VO-NAME>_DEFAULT_SE is needed. This variable points to the Default Storage Element for that VO.

The examples given hereafter refer to the simple configuration method described above. In the following description we will refer to the two possible locations as to the <LCG_ENV_LOC>.
So, according to the cases above described, either

<LCG_ENV_LOC>=/etc/profile.d

or

<LCG_ENV_LOC>=<INSTALL_ROOT>/etc/profile.d

Examples:

- Example of file *<LCG_ENV_LOC>/lcgenv.sh*:

```sh
#!/bin/sh
export LCG_GFAL_INFOSYS=lxb1769.cern.ch:2170
export MYPROXY_SERVER=lxb1774.cern.ch
export PATH="${PATH}:/opt/d-cache-client/bin"
export LD_LIBRARY_PATH=${LD_LIBRARY_PATH}:/opt/d-cache-client/dcap
export SRM_PATH=/opt/d-cache-client/srm
export VO_ATLAS_SW_DIR=lxb1780.cern.ch
export VO_ATLAS_DEFAULT_SE=lxb1780.cern.ch
export VO_ALICE_SW_DIR=lxb1780.cern.ch
export VO_ALICE_DEFAULT_SE=lxb1780.cern.ch
export VO_LHCB_SW_DIR=lxb1780.cern.ch
export VO_LHCB_DEFAULT_SE=lxb1780.cern.ch
export VO_CMS_SW_DIR=lxb1780.cern.ch
export VO_CMS_DEFAULT_SE=lxb1780.cern.ch
export VO_DTEAM_SW_DIR=lxb1780.cern.ch
export VO_DTEAM_DEFAULT_SE=lxb1780.cern.ch
```

- Example of file *<LCG_ENV_LOC>/lcgenv.csh*:

```csh
#!/bin/csh
setenv LCG_GFAL_INFOSYS lxb1769.cern.ch:2170
setenv MYPROXY_SERVER lxb1774.cern.ch
setenv PATH "${PATH}:/opt/d-cache-client/bin"
setenv LD_LIBRARY_PATH ${LD_LIBRARY_PATH}:/opt/d-cache-client/dcap
setenv SRM_PATH /opt/d-cache-client/srm
setenv VO_ATLAS_SW_DIR lxb1780.cern.ch
setenv VO_ATLAS_DEFAULT_SE lxb1780.cern.ch
setenv VO_ALICE_SW_DIR lxb1780.cern.ch
setenv VO_ALICE_DEFAULT_SE lxb1780.cern.ch
setenv VO_LHCB_SW_DIR lxb1780.cern.ch
setenv VO_LHCB_DEFAULT_SE lxb1780.cern.ch
setenv VO_CMS_SW_DIR lxb1780.cern.ch
setenv VO_CMS_DEFAULT_SE lxb1780.cern.ch
setenv VO_DTEAM_SW_DIR lxb1780.cern.ch
setenv VO_DTEAM_DEFAULT_SE lxb1780.cern.ch
```

WARNING: The two scripts must be executable by all users.

```
> chmod a+x ${LCG_ENV_LOC}/lcgenv.csh
> chmod a+x ${LCG_ENV_LOC}/lcgenv.sh
```

18.1. SPECIFICATION OF FUNCTION: CONFIG_LCGENV

The function *'config_lcgenv'* needs the following variables to be set in the configuration file:

BDII_HOST : BDII Hostname.

CE_HOST : Computing Element Hostname.

DPM_HOST : Host name of the DPM host, used also as a default DPM for the lcg-stdout-mon .

EDG_WL_SCRATCH : Set this if you want jobs to use a particular scratch area.

EDG_WL_SCRATCH : Set this if you want jobs to use a particular scratch area.

GLOBUS_TCP_PORT_RANGE : Port range for Globus IO.

GSSKLOG : yes or no, indicating whether the site provides an AFS authentication server which maps gsi credentials into Kerberos tokens .

GSSKLOG_SERVER : If GSSKLOG is yes, the name of the AFS authentication server host.

INSTALL_ROOT : Installation root - change if using the re-locatable distribution.

PX_HOST : PX hostname.

SE_LIST : A list of hostnames of the SEs available at your site.

SITE_NAME : Your GIIS.

VOBOX_HOST : VOBOX hostname.

VOS : List of supported VOs. For each item listed in the VOS variable you need to create a set of new variables as follows:

> **VO_<VO-NAME>_SE :** Default SE used by the VO. WARNING: VO-NAME must be in capital cases.
>
> **VO_<VO-NAME>_SW_DIR :** Area on the WN for the installation of the experiment software. If on the WNs a predefined shared area has been mounted where VO managers can pre-install software, then these variable should point to this area. If instead there is not a shared area and each job must install the software, then this variables should contain a dot (.).Anyway the mounting of shared areas, as well as the local installation of VO software is not managed by *yaim* and should be handled locally by Site Administrators. WARNING: VO-NAME must be in capital cases.

The function does exit with return code 1 if they are not set.

The original code of the function can be found in:

`/opt/lcg/yaim/functions/config_lcgenv`

The code is reproduced also in 28.16..

19. CREATE EXPERIMENT SOFTWARE DIRECTORIES

Author(s): Vidic,Valentin
Email : support-lcg-manual-install@cern.ch

This chapter describes the configuration steps done by the *yaim* function '*config_sw_dir*'.

For each of the supported VOs, experiment software directory is created as specified by <VO_<vo>_SW_DIR> variable.

Ownership of the created directory is changed to VO's SGM user and group.

It is assumed that <VO_<vo>_SW_DIR> is NFS mounted so that running this function on a WN will create software directories for the whole site.

19.1. SPECIFICATION OF FUNCTION: CONFIG_SW_DIR

The function *'config_sw_dir'* needs the following variables to be set in the configuration file:

VOS : List of supported VOs. For each item listed in the VOS variable you need to create a set of new variables as follows:

  VO_<VO-NAME>_SW_DIR : Area on the WN for the installation of the experiment software. If on the WNs a predefined shared area has been mounted where VO managers can pre-install software, then these variable should point to this area. If instead there is not a shared area and each job must install the software, then this variables should contain a dot (.).Anyway the mounting of shared areas, as well as the local installation of VO software is not managed by *yaim* and should be handled locally by Site Administrators. WARNING: VO-NAME must be in capital cases.

The original code of the function can be found in:

```
/opt/lcg/yaim/functions/config_sw_dir
```

The code is also reproduced in 28.17..

20. SET-UP REPLICA MANAGER

Author(s): Vidic,Valentin
Email : support-lcg-manual-install@cern.ch

This chapter describes the configuration steps done by the *yaim* function '*config_replica_manager*'.

Variable substitutions are generated in *<INSTALL_ROOT>/edg/etc/edg-replica-manager/edg-replica-manager.conf.values_local*:

```
@EDG.LOCATION@|<INSTALL_ROOT>/edg|location of edg middleware
@LOCALDOMAIN@|<domain>|the local domain
@DEFAULT.SE@|<SE_HOST>|the host of the close SE
@DEFAULT.CE@|<CE_HOST>|the host of the close CE
@INFOSERVICE@|MDS|The info provider to use. It can be Stub, MDS or RGMA
@RLS.MODE@|LrcOnly|The mode the RLS should be run in. LrcOnly or WithRli
@STUBFILE@||The properties file for the static file – only needed in Stub mode
@MDS.HOST@|<BDII_HOST>|The host of the MDS info provider
@MDS.PORT@|2170|The port of the MDS info provider
@ROS.FAILURE@|false|Fail if no ROS is available
@CONF.GCC@|_gcc3_2_2|The gcc suffix as used on the build box (empty for 2.95, _gcc3_2_2 for 3.2.)
@IGNORE.PREFIX@|true|Whether the RM will ignore the lfn and guid prefix.
@GRIDFTP.DCAU@|false|Does GridFTP use Data Channel Authentication (DCAU)
@GRIDFTP.STREAMS.SMALL@|1|The default number of stream to use for a small file
@GRIDFTP.STREAMS.BIG@|3|The default number of stream to use for a big file
@GRIDFTP.FILESIZE.THRESHOLD@|100|The Threshold (in MB) above which a file to transfer is considered "big"
```

The value of <domain> is determined by running *hostname -d*. Using these substitutions and templates in *<INSTALL_ROOT>/edg/etc/edg-replica-manager/*, Replica Manager is configured by generating files in *<EDG_LOCATION>/var/etc/edg-replica-manager*:

```
<INSTALL_ROOT>/edg/sbin/edg-replica-manager-configure <INSTALL_ROOT>/edg/etc/edg-replica-manager/edg-replica-manage
```

20.1. SPECIFICATION OF FUNCTION: CONFIG_REPLICA_MANAGER

The function *'config_replica_manager'* needs the following variables to be set in the configuration file:

BDII_HOST : BDII Hostname.

CE_HOST : Computing Element Hostname.

INSTALL_ROOT : Installation root - change if using the re-locatable distribution.

SE_LIST : A list of hostnames of the SEs available at your site.

The original code of the function can be found in:

```
/opt/lcg/yaim/functions/config_replica_manager
```

The code is also reproduced in 28.18..

21. SET-UP LCMAPS

Author(s): Vidic,Valentin
Email : support-lcg-manual-install@cern.ch

This chapter describes the configuration steps done by the *yaim* function '*config_lcmaps*'.

Local Credential Mapping Service (LCMAPS) determines the mapping of grid user credentials (proxy certificates) to local (Unix) accounts and groups. LCMAPS is configured by creating *<IN-STALL_ROOT>/edg/etc/lcmaps/lcmaps.db*. Modules and two policies are defined:

```
# where to look for modules
path = ${INSTALL_ROOT}/edg/lib/lcmaps/modules

# module definitions
posixenf = "lcmaps_posix_enf.mod -maxuid 1 -maxpgid 1 -maxsgid 32 "
localaccount = "lcmaps_localaccount.mod  -gridmapfile /etc/grid-security/grid-mapfile"
poolaccount = "lcmaps_poolaccount.mod  -gridmapfile /etc/grid-security/grid-mapfile -gridmapdir /etc/grid-security/
vomsextract = "lcmaps_voms.mod  -vomsdir /etc/grid-security/vomsdir/ -certdir /etc/grid-security/certificates/"
vomslocalgroup = "lcmaps_voms_localgroup.mod  -groupmapfile ${INSTALL_ROOT}/edg/etc/lcmaps/groupmapfile -mapmin 0"
vomspoolaccount = "lcmaps_voms_poolaccount.mod  -gridmapfile ${INSTALL_ROOT}/edg/etc/lcmaps/gridmapfile -gridmapdir
vomslocalaccount = "lcmaps_voms_localaccount.mod  -gridmapfile ${INSTALL_ROOT}/edg/etc/lcmaps/gridmapfile -use_voms

# policies
voms:
vomsextract -> vomslocalgroup
vomslocalgroup -> vomspoolaccount
vomspoolaccount -> posixenf | vomslocalaccount
vomslocalaccount -> posixenf

standard:
localaccount -> posixenf | poolaccount
poolaccount -> posixenf
```

If the user's proxy certificate contains VOMS attributes, they are used to map the user to local account and group. Otherwise, proxy certificate subject is used to map the user according to */etc/grid-security/grid-mapfile*.

21.1. SPECIFICATION OF FUNCTION: CONFIG_LCMAPS

The function *'config_lcmaps'* needs the following variables to be set in the configuration file:

INSTALL_ROOT : Installation root - change if using the re-locatable distribution.

The original code of the function can be found in:

```
/opt/lcg/yaim/functions/config_lcmaps
```

The code is also reproduced in 28.19..

22. SET-UP LCAS

Author(s): Vidic,Valentin
Email : support-lcg-manual-install@cern.ch

This chapter describes the configuration steps done by the *yaim* function '*config_lcas*'.

Local Centre Authorization Service (LCAS) handles authorization requests to the local resource. LCAS is configured by creating the file *<INSTALL_ROOT>/edg/etc/lcas/lcas.db*. By default the following authorization plugins are enabled:

```
pluginname=lcas_userban.mod,pluginargs=ban_users.db
pluginname=lcas_timeslots.mod,pluginargs=timeslots.db
pluginname=lcas_plugin_example.mod,pluginargs=arguments
```

lcas_userban.mod module can be used to ban specific users from the resource. It is configured in *<INSTALL_ROOT>/edg/etc/lcas/ ban_users.db* with an empty (no users banned) configuration.

lcas_timeslots.mod module can be used disable access to the resource at certain times of day/week/month. It is configured in *<INSTALL_ROOT>/edg/etc/lcas/timeslots.db* with a default (always open) configuration.

lcas_plugin_example.mod is an dummy plugin that can be used for creating site specific authorization plugins.

22.1. SPECIFICATION OF FUNCTION: CONFIG_LCAS

The function '*config_lcas*' needs the following variables to be set in the configuration file:

INSTALL_ROOT : Installation root - change if using the re-locatable distribution.

The original code of the function can be found in:

```
/opt/lcg/yaim/functions/config_lcas
```

The code is also reproduced in 28.20..

23. SET-UP WORKLOAD MANAGER CLIENT

Author(s): Vidic,Valentin
Email : support-lcg-manual-install@cern.ch

This chapter describes the configuration steps done by the *yaim* function '*config_workload_manager_client*'.

For each of the supported VOs, a configuration file is generated in *<INSTALL_ROOT>/edg/etc/<vo>/edg_wl_ui.conf*:

```
[
VirtualOrganisation = "<vo>";
NSAddresses = "<RB_HOST>:7772";
LBAddresses = "<RB_HOST>:9000";
## HLR location is optional. Uncomment and fill correctly for
## enabling accounting
#HLRLocation = "fake HLR Location"
## MyProxyServer is optional. Uncomment and fill correctly for
## enabling proxy renewal. This field should be set equal to
## MYPROXY_SERVER environment variable
MyProxyServer = "<PX_HOST>"
]
```

This file defines RB and MyProxy server to be used for a specific VO.

Defaults common to all VOs are defined in *<INSTALL_ROOT>/edg/etc/edg_wl_ui_cmd_var.conf*:

```
[
rank = - other.GlueCEStateEstimatedResponseTime;
requirements = other.GlueCEStateStatus == "Production";
RetryCount = 3;
ErrorStorage = "/tmp";
OutputStorage = "<OUTPUT_STORAGE>";
ListenerPort = 44000;
ListenerStorage = "/tmp";
LoggingTimeout = 30;
LoggingSyncTimeout = 30;
LoggingDestination = "<RB_HOST>:9002";
# Default NS logger level is set to 0 (null)
# max value is 6 (very ugly)
NSLoggerLevel = 0;
DefaultLogInfoLevel = 0;
DefaultStatusLevel = 0;
DefaultVo = "unspecified";
]
```

and *<INSTALL_ROOT>/edg/etc/edg_wl_ui_gui_var.conf*:

```
[
JDLEDefaultSchema = "Glue";
Glue = [
rank = - other.GlueCEStateEstimatedResponseTime;
rankMPI = other.GlueCEStateFreeCPUs;
requirements = other.GlueCEStateStatus == "Production"
```

```
];
EDG = [
rank = - other.EstimatedTraversalTime;
rankMPI = other.FreeCPUs;
requirements = true
];
RetryCount = 3;
ErrorStorage = "/tmp";
OutputStorage = "<OUTPUT_STORAGE>;
ListenerPort = 44000;
ListenerStorage = "/tmp";
LoggingTimeout = 30;
LoggingSyncTimeout = 30;
LoggingDestination = "<RB_HOST>:9002";
# Default NS logger level is set to 0 (null)
# max value is 6 (very ugly)
NSLoggerLevel = 0;
DefaultLogInfoLevel = 0;
DefaultStatusLevel = 0;
DefaultVo = "unspecified";
]
```

Directory for storing job output sandboxes (<OUTPUT_STORAGE>) is created.

Finally, *edg-wl-ui-env.csh*, *edg-wl-ui-env.sh*, *edg-wl-ui-gui-env.csh* and *edg-wl-ui-gui-env.sh* are copied from *<INSTALL_ROOT>/edg/etc/profile.d/* to *<INSTALL_ROOT>/edg/var/etc/profile.d*. These scrips are sourced from */etc/profile.d* and are used to setup the environment for EDG programs.

23.1. SPECIFICATION OF FUNCTION: CONFIG_WORKLOAD_MANAGER_CLIENT

The function *'config_workload_manager_client'* needs the following variables to be set in the configuration file:

INSTALL_ROOT : Installation root - change if using the re-locatable distribution.

OUTPUT_STORAGE : Default Output directory for the jobs.

PX_HOST : PX hostname.

RB_HOST : Resource Broker Hostname.

VOS : List of supported VOs.

The original code of the function can be found in:

```
/opt/lcg/yaim/functions/config_workload_manager_client
```

The code is also reproduced in 28.21..

24. SET-UP FILE TRANSFER SERVICE CLIENT

Author(s): Vidic,Valentin
Email : support-lcg-manual-install@cern.ch

This chapter describes the configuration steps done by the *yaim* function '*config_fts_client*'.

If <FTS_SERVER_URL> is set, gLite FTS client is configured by creating <INSTALL_ROOT>/glite/etc/services.xml:

```
<services>

  <service name="EGEEfts">
    <parameters>
      <endpoint><FTS_SERVER_URL>/services/FileTransfer</endpoint>
      <type>org.glite.FileTransfer</type>
      <version>3.0.0</version>
    </parameters>
  </service>

  <service name="EGEEchannel">
    <parameters>
      <endpoint><FTS_SERVER_URL>/services/ChannelManagement</endpoint>
      <type>org.glite.ChannelManagement</type>
      <version>3.0.0</version>
    </parameters>
  </service>

</services>
```

24.1. SPECIFICATION OF FUNCTION: CONFIG_FTS_CLIENT

The function *'config_fts_client'* needs the following variables to be set in the configuration file:

FTS_SERVER_URL : URL of the File Transfer Service server.

INSTALL_ROOT : Installation root - change if using the re-locatable distribution.

The original code of the function can be found in:

```
/opt/lcg/yaim/functions/config_fts_client
```

The code is also reproduced in 28.22..

---

25. SET-UP GLITE ENVIRONMENT

Author(s): Vidic,Valentin
Email : support-lcg-manual-install@cern.ch

This chapter describes the configuration steps done by the *yaim* function '*config_glite_env*'.

/etc/profile.d/gliteenv.sh and */etc/profile.d/gliteenv.csh* are created. These scripts set enviroment variables needed to run gLite programs, for example */etc/profile.d/gliteenv.sh*:

```
if test "x${LCG_ENV_SET+x}" = x; then

    GLITE_LOCATION=${GLITE_LOCATION:-/opt/glite}
    GLITE_LOCATION_VAR=${GLITE_LOCATION_VAR:-$GLITE_LOCATION/var}
    GLITE_LOCATION_LOG=${GLITE_LOCATION_LOG:-$GLITE_LOCATION/log}
    GLITE_LOCATION_TMP=${GLITE_LOCATION_TMP:-$GLITE_LOCATION/tmp}

    if [ -z "$PATH" ]; then
        PATH="${GLITE_LOCATION}/bin:${GLITE_LOCATION}/externals/bin"
    else
        PATH="${PATH}:${GLITE_LOCATION}/bin:${GLITE_LOCATION}/externals/bin"
    fi

    if [ -z "$LD_LIBRARY_PATH" ]; then
        LD_LIBRARY_PATH="${GLITE_LOCATION}/lib:${GLITE_LOCATION}/externals/lib"
    else
        LD_LIBRARY_PATH="${LD_LIBRARY_PATH}:${GLITE_LOCATION}/lib:${GLITE_LOCATION}/externals/lib"
    fi

    if [ -z "$PERLLIB" ]; then
        PERLLIB="${GLITE_LOCATION}/lib/perl5"
    else
        PERLLIB="${PERLLIB}:${GLITE_LOCATION}/lib/perl5"
    fi

    if [ -z "$MANPATH" ]; then
        MANPATH="${GLITE_LOCATION}/share/man"
    else
        MANPATH="${MANPATH}:${GLITE_LOCATION}/share/man"
    fi

    export GLITE_LOCATION GLITE_LOCATION_VAR GLITE_LOCATION_LOG GLITE_LOCATION_TMP PATH LD_LIBRARY_PATH PERLLIB MAN

fi
```

/etc/profile.d/gliteenv.csh has the same functionality but for CSH compatible shells.

25.1. SPECIFICATION OF FUNCTION: CONFIG_GLITE_ENV

The function *'config_glite_env'* needs the following variables to be set in the configuration file:

INSTALL_ROOT : Installation root - change if using the re-locatable distribution.

The original code of the function can be found in:

`/opt/lcg/yaim/functions/config_glite_env`

The code is also reproduced in 28.23..

26. SET-UP GSI ENABLED SSH

Author(s): Vidic,Valentin
Email : support-lcg-manual-install@cern.ch

This chapter describes the configuration steps done by the *yaim* function '*config_gsissh*'.

First, the generic configuration script (*<INSTALL_ROOT>/globus/setup/gsi_openssh_setup/setup-openssh*) is run (if it exists). It will generate host keys and a default configuration.

At the moment, further configuration is only done for *VOBOX* nodes.

Configuration files for SSH daemon and client are modified to use GSI authentication. All other authentication types and root login are disabled for the daemon.

The startup script is modified to make the *gsisshd* listen on a nondefault port (<VOBOX_PORT>). It is than installed as */etc/init.d/gsisshd*. The *gsisshd* daemon is restarted and configured to start on boot.

26.1. SPECIFICATION OF FUNCTION: CONFIG_GSISSH

The function '*config_gsissh*' needs the following variables to be set in the configuration file:

INSTALL_ROOT : Installation root - change if using the re-locatable distribution.

VOBOX_PORT : The port the VOBOX gsisshd listens on.

The original code of the function can be found in:

```
/opt/lcg/yaim/functions/config_gsissh
```

The code is also reproduced in 28.24..

27. SET-UP VOBOX

Author(s): Vidic,Valentin
Email : support-lcg-manual-install@cern.ch

This chapter describes the configuration steps done by the *yaim* function '*config_vobox*'.

For each of the supported VOs (<VOS> variable), appropriate SGM account is unlocked to enable login using GSISSH.

For each of the supported VOs, proxy renewal service is installed in */etc/rc.d/init.d/<vo>-box-proxyrenewal*. This service periodically renews (from MyProxy) proxy certificates used by agents running on the VOBOX. The service is restarted and configured to start on boot. Cron job for renewing service proxy (from host certificate) is installed to run four times a day. Log rotation is also configured for service logs in *<INSTALL_ROOT>/vobox/<vo>/log/events.log*.

For each of the supported VOs, the following directories are created:

- *<INSTALL_ROOT>/vobox/<vo>/start/*

- *<INSTALL_ROOT>/vobox/<vo>/stop/*

- *<INSTALL_ROOT>/vobox/<vo>/agents/*

VO SGMs install agent startup scripts in the *agents* directory and create symbolic links to the startup script in *start* and *stop* directories. The agents are started/stopped from */etc/rc.d/init.d/<vo>-box-proxyrenewal*.

27.1. SPECIFICATION OF FUNCTION: CONFIG_VOBOX

The function '*config_vobox*' needs the following variables to be set in the configuration file:

INSTALL_ROOT : Installation root - change if using the re-locatable distribution.

USERS_CONF : Path to the file containing a list of Linux users (pool accounts) to be created. This file should be created by the Site Administrator, which contains a plain list of the users and IDs. An example of this configuration file is given in /opt/lcg/yaim/examples/users.conf.

VOS : List of supported VOs.

The original code of the function can be found in:

```
/opt/lcg/yaim/functions/config_vobox
```

The code is also reproduced in 28.25..

28. SOURCE CODE

28.1. CONFIG_LDCONF

```
config_ldconf () {

    INSTALL_ROOT=${INSTALL_ROOT:-/opt}

cp -p /etc/ld.so.conf /etc/ld.so.conf.orig

    LIBDIRS="${INSTALL_ROOT}/globus/lib \
     ${INSTALL_ROOT}/edg/lib \
            ${INSTALL_ROOT}/edg/externals/lib/ \
     /usr/local/lib \
            ${INSTALL_ROOT}/lcg/lib \
            /usr/kerberos/lib \
            /usr/X11R6/lib \
            /usr/lib/qt-3.1/lib \
            ${INSTALL_ROOT}/gcc-3.2.2/lib \
            ${INSTALL_ROOT}/glite/lib \
            ${INSTALL_ROOT}/glite/externals/lib"

    if [ -f /etc/ld.so.conf.add ]; then
rm -f /etc/ld.so.conf.add
    fi

    for libdir in ${LIBDIRS}; do
if ( ! grep -q $libdir /etc/ld.so.conf && [ -d $libdir ] ); then
    echo $libdir >> /etc/ld.so.conf.add
fi
    done

    if [ -f /etc/ld.so.conf.add ]; then
sort -u /etc/ld.so.conf.add >> /etc/ld.so.conf
rm -f  /etc/ld.so.conf.add
    fi

    /sbin/ldconfig

    return 0
}
```

28.2. CONFIG_SYSCONFIG_EDG

```
config_sysconfig_edg(){

INSTALL_ROOT=${INSTALL_ROOT:-/opt}

cat <<EOF > /etc/sysconfig/edg
EDG_LOCATION=$INSTALL_ROOT/edg
```

```
EDG_LOCATION_VAR=$INSTALL_ROOT/edg/var
EDG_TMP=/tmp
X509_USER_CERT=/etc/grid-security/hostcert.pem
X509_USER_KEY=/etc/grid-security/hostkey.pem
GRIDMAP=/etc/grid-security/grid-mapfile
GRIDMAPDIR=/etc/grid-security/gridmapdir/
EDG_WL_BKSERVERD_ADDOPTS=--rgmaexport
EDG_WL_RGMA_FILE=/var/edgwl/logging/status.log
EOF

return 0
}
```
