

LHC COMPUTING GRID

LCG RESOURCE BROKER MANUAL INSTALLATION AND CONFIGURATION

Document identifier: **LCG-GIS-MI-RB**

EDMS id: **none**

Version: **v2.9.2**

Date: **August 20, 2004**

Section: **LCG Grid Deployment**

Document status: **Status: Fully Working**

Author(s): Alessandro Usai, Antonio Retico

File: **RB**

Abstract: **LCG Resource Broker Manual Installation Guide**

CONTENTS

1. PREREQUISITES FOR INSTALLATION	6
2. RESOURCE BROKER SOFTWARE INSTALLATION	7

ABSTRACT

Manual steps for the installation and configuration of a LCG RB Node based on a standard (non CERN-like) Red Hat 7.3 installation

Link to this document:

This document is available on the *Grid Deployment* web site

<http://www.cern.ch/grid-deployment/gis/release-docs/RB-index.html>

There you need to select the version tag before downloading the corresponding version of the guide. Other documents labeled with "cvs:", in the *References*, are maintained in txt version into the LCG cvs repository.

They can be downloaded via web by browsing the LCG Deployment home page

<http://www.cern.ch/grid-deployment/>

following then the **CVS Deployment** link on the left side of the page.

1. PREREQUISITES FOR INSTALLATION

In order to install the RB software you need:

- a working Linux Redhat7.3 on the Resource Broker (This procedure has been tested on a basic RH7.3 and should not differ for more or less equivalent versions of RH. Should it be so please contact us)
- root account on RB machine
- references to software packages to be installed (see below)

2. RESOURCE BROKER SOFTWARE INSTALLATION

In order to have a running RB the following software must be installed

- RB package
- Other software which a group may rely on

Two different methods are supported for RB software installation

- Centrally managed RB installation using the Debian *apt-get* tool
- Manual RB installation using the Red Hat *rpm* tool.

The first method is simple and straightforward. Node-specific meta-packages define and hide the list of rpms to be installed. Dependencies among rpms, in particular, are easily managed by the *apt-get* tool. This may help if on your site you are running a customized version of Red Hat and you prefer not to solve dependencies manually.

On the other side, the installation using *apt-get* gives to site administrators poor control on installation and on the way the dependencies are solved.

The second method gives full control to site administrators for the installation, because it is based on an explicitly declared set of rpms to be installed on top of Red Hat 7.3

On the other hand, the installation procedure is slower and needs each unmanaged dependency to be manually solved.

2.1. RB INSTALLATION USING *apt-get*

in order to install your Resource Broker using *apt-get* please refer to the following document:

<http://www.cern.ch/grid-deployment/gis/aptDB/>

2.2. RB INSTALLATION USING *rpm*

All the tools needed for LCG releases are available on the *Grid Deployment* web site

<http://www.cern.ch/grid-deployment/gis/release-docs/RB-index.html>

You can start browsing by selecting the relevant version tag.

Once selected your tag, you will be moved to a page where you can find:

RB.pdf: this guide

RB_manual_install_rpm: plain full list of those rpms needed to install the RB software on top of a plain RH7.3 installation, whose dependencies are already dealt with.

RB_manual_install_forced_rpm: plain full list of those rpms needed to install the RB software on top of a plain RH7.3 installation, and whose dependencies are NOT dealt with, therefore requiring a forced installation. If this list is not present or void it means that no rpm needs to be forced

RB_manual_install_wget: a shell script which downloads, from the LCG mirror site at CERN, the rpms included into the list *RB_manual_install_rpm*

RB_manual_install_extra_rpm: a short list of rpms which RH7.3 does not install by default, but which have been turned out to be required in order to have the SE software installed. This list is provided just for reference, since the rpms from this list are already included into the list *RB_manual_install_rpm*

If any file of the mentioned list is not in the repository it means that it is not applicable within the installation of the current tag. So each further reference to it in this guide can be simply ignored.

All the above mentioned files are grouped in the archive file **RB.tools.tar.gz**. So they can be easily downloaded and used on target machines.

The provided *RB_manual_install_rpm* includes:

- all the packages which are needed in order to have a production Resource Broker.
- all the general purpose objects (i.e. shared libraries or common applications) which the RB installation needs in order to run and which are not included in the standard operative system. The composition of this group of rpms may vary depending on what is considered "basic OS" at each site, and so it cannot be easily defined in a static way. Given the previous considerations, this part of the provided list may be not exhaustive.

A possible way to use the provided tools is decribed in the next sections

Download rpms from the repository in a local directory

- log in as *root* into the node to be installed and copy there the file **RB.tools.tar.gz**.
- extract the archived files.

```
> gunzip RB_tools.tar.gz  
> tar xvzf RB_tools.tar
```

- give execution permissions and run the script *RB_manual_install_wget*, which will then fetch all the rpms required into the subdirectories *RB_INSTALL* and *RB_INSTALL_FORCED*

```
> cd RB_tools  
> chmod u+x RB_manual_install_wget  
> ./RB_manual_install_wget
```

Install the downloaded rpms

- In the directory **RB_INSTALL**, where the rpms listed in *RB_manual_install_rpm* have been downloaded, run the command

```
> rpm -Uvh *.rpm"
```

- In the directory **RB_INSTALL_FORCED** where the rpms listed in *RB_manual_install_forced_rpm* have been downloaded, run the command

```
> rpm -Uvh --nodeps *.rpm"
```

Due to possible missing rpms this operation might yield some missing dependencies which have to be analyzed and solved by adding/removing rpms to/from the *RB_manual_install_rpm* list.

Should you prefer to do an upgrade of the RB software already installed at your site instead of a new installation, the necessary steps are listed in the upgrade procedure usually reported in the last section of the RB installation guide.

This procedure, when available, refers to changes occurring between the current version and the previous one. This also means that the procedure is not applicable if the software at your site is more than two tags old.

2.3. INSTALLING THE CERTIFICATION AUTHORITY RPMS

As the list and structure of Certification Authorities (CA) accepted by the LCG project can change independently of the middleware releases, the rpm list related to the CAs certificates and URLs has been decoupled from the standard LCG release procedure. You should consult the page

<http://markusw.home.cern.ch/markusw/lcg2CAlist.html>

in order to ascertain what the version number of the latest set of CA rpms is. At time of writing it is 1.6, so the full set of rpms can be downloaded with the following command;

```
> wget -l1 -nd -r http://grid-deployment.web.cern.ch/grid-deployment/download/RpmDir/security/index_r1.6.html
```

These rpms should then be installed in the usual way;

```
> rpm -Uvh *.rpm
```

Changes and updates to these settings will be announced on the LCG-Rollout mailing list.

3. NTP CLIENT INSTALLATION & CONFIGURATION

A general requirement for the LCG nodes is that they should be synchronized. This requirement may be fulfilled in several ways. If your nodes run under AFS most likely they are already synchronized. Otherwise, you can use the NTP protocol with a time server.

Instructions and examples for a NTP client configuration are provided in this section. If you are not planning to use a time server on your machine you can just skip it.

3.1. NTP SOFTWARE INSTALLATION

In order to install the NTP client, you need the following rpms to be installed:

- ntp
- libcap
- libcap-devel

The following versions of the above said rpms have been proven to work on our OS configuration (the list includes the corresponding links to download sites):

- ntp-4.1.1-1

<http://grid-deployment.web.cern.ch/grid-deployment/download/RpmDir/release/ntp-4.1.1-1.i386.rpm>

- libcap-devel-1.10-8

<http://grid-deployment.web.cern.ch/grid-deployment/download/RpmDir/release/libcap-devel-1.10-8.i386.rpm>

- libcap-1.10-8

<http://grid-deployment.web.cern.ch/grid-deployment/download/RpmDir/release/libcap-1.10-8.i386.rpm>

A complete example of NTP rpms download and installation has been provided in 3.3..

3.2. NTP CONFIGURATION

- Configure the file */etc/ntp.conf* by adding the lines dealing with your time server configuration such as, for instance:

```
restrict <time_server_IP_address> mask 255.255.255.255 nomodify notrap noquery
server <time_server_name>
```

Additional time servers can be added for better performance results. For each server, the hostname and IP address are required. Then, for each time-server you are using, add a couple of lines similar to the ones shown above into the file */etc/ntp.conf*.

- Edit the file */etc/ntp/step-tickers* adding a list of your time server(s) hostname(s), as in the following example:

137.138.16.69
137.138.17.69

- If you are running a kernel firewall, you will have to allow inbound communication on the NTP port. If you are using ipchains, you can do this by adding the following to */etc/sysconfig/ipchains*

```
-A input -s <NTP-serverIP-1> -d 0/0 123 -p udp -j ACCEPT
-A input -s <NTP-serverIP-2> -d 0/0 123 -p udp -j ACCEPT
```

Remember that ipchains rules are parsed in order, so ensure that there are no matching REJECT lines preceding those that you add. You can then reload the firewall

```
> /etc/init.d/ipchains restart
```

- Activate the ntpd service with the following commands:

```
> ntpdate <your ntp server name>
> service ntpd start
> chkconfig ntpd on
```

A complete example of NTP configuration has been provided in 3.3.

3.3. EXAMPLE OF NTP CLIENT INSTALLATION AND CONFIGURATION

This section reports a complete example of NTP server configuration done in the CERN context.

- install NTP

```
> wget http://grid-deployment.web.cern.ch/grid-deployment/download/RpmDir/release/ntp-4.1.1-1.i386.rpm
> wget http://grid-deployment.web.cern.ch/grid-deployment/download/RpmDir/release/libcap-devel-1.10-8.i386.rpm
> wget http://grid-deployment.web.cern.ch/grid-deployment/download/RpmDir/release/libcap-1.10-8.i386.rpm
> rpm -ivh libcap-1.10-8.i386.rpm libcap-devel-1.10-8.i386.rpm ntp-4.1.1-1.i386.rpm
```

- Configure the file */etc/ntp.conf*:

the lines

```
restrict 137.138.16.69 mask 255.255.255.255 nomodify notrap noquery
server 137.138.16.69
restrict 137.138.17.69 mask 255.255.255.255 nomodify notrap noquery
server 137.138.17.69
```

have been added to the file */etc/ntp.conf*

-
- Edit the file */etc/ntp/step-tickers*:

the lines

```
137.138.16.69  
137.138.17.69
```

have been added to the file */etc/ntp/step-tickers*

- Edit */etc/sysconfig/ipchains* adding

```
-A input -s 137.138.16.69 -d 0/0 123 -p udp -j ACCEPT  
-A input -s 137.138.17.69 -d 0/0 123 -p udp -j ACCEPT
```

then reload the firewall

```
> /etc/init.d/ipchains restart
```

- Activate the ntpd server

```
> ntpdate ip-time-1.cern.ch  
> service ntpd start  
> chkconfig ntpd on
```

- You can check ntpd's status by running the following command

```
> ntpq -p
```

As far as the disk partitioning of the machine at the moment of the RH 7.3 installation is concerned, it is recommended that the /tmp partition be given as much space as possible!

4. LCG COMMON CONFIGURATION

4.1. SET-UP HOST CERTIFICATES

CE, SE, PROXY, RB nodes require the host certificate/key files before you start their installation. Contact your national certification authority (CA) to understand how to obtain a host certificate and a private key if you do not have them already.

Relevant information on all the trusted CAs can be found in

<http://marianne.in2p3.fr/datagrid/ca/ca-table-ca.html>

which lists the CAs used by edg, from which you should choose a CA close to you.

Once you have obtained a valid certificate, i.e. a file

hostcert.pem

containing the machine host certificate and a file

hostkey.pem

containing the machine private key, make sure to place the two files into the directory

/etc/grid-security

with the following permissions

> chmod 400 /etc/grid-security/hostkey.pem

> chmod 644 /etc/grid-security/hostcert.pem

It is IMPORTANT that permissions be set as shown, as otherwise certification errors will occur!!!

4.2. CONFIGURE DYNAMIC LINKER RUN-TIME BINDINGS

If not already present, append the following lines to the file */etc/ld.so.conf*

```
/opt/gcc-3.2.2/lib
/opt/globus/lib
/opt/edg/lib
/usr/local/lib
```

- Run the command:

```
> /sbin/ldconfig -v
```

(It produces a huge amount of output)

4.3. CREATE TOP-LEVEL EDG CONFIGURATION FILE

This file is parsed by EDG daemons to locate the EDG root directory and various other global properties.

Create and edit the file `/etc/sysconfig/edg` as follows:

```
# Root directory for EDG software. (mandatory)
# Usual value: /opt/edg
EDG_LOCATION=/opt/edg

# Directory for machine-specific files.
# Usual value: $EDG_LOCATION/var

EDG_LOCATION_VAR=/opt/edg/var

# World writable directory for temporary files. (mandatory)
# Usual value: /tmp
EDG_TMP=/tmp

# The directory containing trusted certificates and CRLs (CERTDIR).
# Usual value: /etc/grid-security/certificates

# Host certificate (X509_USER_CERT) for services which don't have their own.
# Usual value: /etc/grid-security/hostcert.pem

X509_USER_CERT=/etc/grid-security/hostcert.pem

# Host key (X509_USER_KEY) for services which don't have their own.
# Usual value: /etc/grid-security/hostkey.pem

X509_USER_KEY=/etc/grid-security/hostkey.pem

# Location of the grid mapfile (GRIDMAP).
# Usual value: /etc/grid-security/grid-mapfile
```

```
GRIDMAP=/etc/grid-security/grid-mapfile
```

```
# Location of the grid map directory for pooled accounts (GRIDMAPDIR) .
```

```
# Usual value: /etc/grid-security/gridmapdir
```

```
GRIDMAPDIR=/etc/grid-security/gridmapdir/
```

4.4. CREATE TOP-LEVEL GLOBUS CONFIGURATON FILE

Create and edit the file */etc/sysconfig/globus* as follows:

```
GLOBUS_LOCATION=/opt/globus
GLOBUS_CONFIG=/etc/globus.conf
GLOBUS_TCP_PORT_RANGE="20000 25000"
```

4.5. CREATE GLOBUS CONFIGURATON FILE

Create and edit the file */etc/globus.conf* as follows below, entering the GIIS node at your site (this is for example a Computing Element):

```
[common]
GLOBUS_LOCATION=/opt/globus
globus_flavor_name=gcc32dbg
x509_user_cert=/etc/grid-security/hostcert.pem
x509_user_key=/etc/grid-security/hostkey.pem
gridmap=/etc/grid-security/grid-mapfile
gridmapdir=/etc/grid-security/gridmapdir/
[mds]
globus_flavor_name=gcc32dbgpthr
user=edginfo
```

```
[mds/gris/provider/edg]
```

```
[mds/gris/registration/site]
regname=cerntestlcg2
reghn=<GIIS_NODE>
```

```
[gridftp]
log=/var/log/globus-gridftp.log

[gatekeeper]
default_jobmanager=fork
job_manager_path=$GLOBUS_LOCATION/libexec

jobmanagers="fork "

[gatekeeper/fork]
type=fork
job_manager=globus-job-manager
```

4.6. LAUNCH GLOBUS INIALIZATION SCRIPT

- Define the *GLOBUS_LOCATION* environment variable (if needed)

```
> export GLOBUS_LOCATION=/opt/globus
```

- Launch setup script

```
> /opt/globus/sbin/globus-initialization.sh
```

This Globus script is meant to be launched on all the LCG nodes, as a general configuration step. Because of this it can yield warning messages as well as some error ones. An example of output to be considered normal in a RB configuration has been produced in Appendix 1. Since the script produces a huge output it is recommended to re-direct the standard output into a log file:

```
> /opt/globus/sbin/globus-initialization.sh > globus-init.log 2>&1
```

4.7. GSI ACCESS CONTROL LIST (GRID-MAPFILE)

The plain text file

/etc/grid-security/grid-mapfile

maps a GSI (Grid Security Infrastructure) Credential to a local user's login name.

The information in this file is verified and if needed periodically updated by the cron job

```
> /opt/edg/sbin/edg-mkgridmap
```

whose configuration file is

`/opt/edg/etc/edg-mkgridmap.conf`

If this in turn is not properly configured, the relevant information of the authorised users will not be fetched or updated, resulting in the node not working properly!!!

Instructions on how to edit edg-mkgridmap.conf can be found in [1].

5. REPLICA MANAGER CONFIGURATION

The edg-replica-manager-config RPM installs the *edg-replica-manager-configure* script into the */opt/edg/sbin* directory. This script can be used to automatically generate the default configuration file.

Before running the script, the file

/opt/edg/etc/edg-replica-manager/edg-replica-manager.conf.values

should be manually edited as input file to the script

/opt/edg/sbin/edg-replica-manager-configure

which automatically writes the local configuration parameters into the *edg-replica-manager.conf* file.

So the two step to be done are outline below.

5.1. EDIT THE LOCAL CONFIGURATION FILE

The file

/opt/edg/etc/edg-replica-manager/edg-replica-manager.conf.values

as above said, should be manually edited. Since it is also created by the edg-replica-manager-config rpm it is advisable to rename it (e.g. *edg-replica-manager.conf.values.local*) so that possible upgrades of the rpm do not overwrite the already existing file.

The file *edg-replica-manager.conf.values* looks like

```
@EDG.LOCATION@|<path>|location of edg middleware
@LOCALDOMAIN@|<domainname>|the local domain
@DEFAULT.SE@|< SE hostname>|the host of the close SE
@DEFAULT.CE@|< CE hostname>|the host of the close CE
@RLS.MODE@|<LrcOnly OR WithRli>|The mode the RLS should be run in. LrcOnly or WithRli
@INFOSERVICE@|<info-provider hostname>|The info provider to use. It can be Stub, MDS or RGMA
@STUBFILE@|<filepath>|The properties file for the static file 'info service'
@MDS.HOST@|<hostname-top-gis>|The host of the MDS info provider
@MDS.PORT@|<portnumber>|The port of the MDS info provider
@ROS.FAILURE@|false|Fail if no ROS is available
@CONF.GCC@|<_gcc3_2_2 OR empty>|The gcc suffix as used on the build box (empty for 2.95, _gcc3_2_2 for 3.2.)
@IGNORE.PREFIX@|true|If true, the lfn and guid prefix will not be passed to the
catalogs
@GRIDFTP.DCAU@|false|Does GridFTP use Data Channel Authentication (DCAU)
@GRIDFTP.STREAMS.SMALL@|1|The default number of stream to use for a small file
@GRIDFTP.STREAMS.BIG@|3|The default number of stream to use for a big file
@GRIDFTP.FILESIZE.THRESHOLD@|100|The Threshold (in MB) above which a file to transfer is considered "big"
```

The parameters have the following meaning:

<**EDG.LOCATION**>: location of edg middleware, normally set to */opt/edg*, it must match with the previous definition in 4.2

<**LOCALDOMAIN**>: your domain name (site-dependent)

<**DEFAULT.SE**>: (site-dependent)

<DEFAULT.CE>: (site-dependent)

<RLS.MODE>: Replica Catalog type: the implementation of the replica catalog interface. Available choices are: - LrcOnly – a single LRC per VO - WithRLi – a full RLS deployed

<INFOSERVICE>: The implementation of the Information Service Interface. The following choices are available:

<Stub>: a local configuration file specified by STUBFILE is used instead of an information service

<RGMA>: R-GMA is contacted for all information service requests

<MDS>: MDS.HOST is contacted on MDS.PORT for all information service requests (this is the correct choice for lcg2)

<STUBFILE>: used if INFOSERVICE is set to "Stub"

<MDS.HOST>: (site-dependent) value used if INFOSERVICE is set to "MDS". It should be a BDII node. If your site owns a BDII use its hostname.

If you have a reference site, ask them for indications or send a message to the "LCG-ROLLOUT@cclrclsv.RL.AC.U mailing list

<MDS.PORT>: used if INFOSERVICE is set to "MDS" (see above)

<ROS.FAILURE>: Failure if ROS is NOT available. This may be set to 'false' if you want the replica manager not to complain if ROS is unavailable (this is the correct choice for lcg2)

<CONE.GCC>: It is the gcc suffix to be concatenated to the name of the JNI library interfacing to gridFTP in the native implementation of the latter one. This dynamic library will be loaded from the classpath. Possible values are:

- empty – for 2.95

- _gcc3_2_2 – for 3.2 (this is the correct choice for lcg2)

IGNORE.PREFIX: This flag, if set to 'true', allows the use of the new RLS, which ignores the prefixes. It should always be set to 'true'

GRIDFTP.DCAU: flag to indicate whether GridFTP uses Data Channel Authentication (DCAU) or not. In current implementation should be set to 'false'

GRIDFTP.STREAMS.SMALL: Default number of streams to use for the transfer of a 'small' file

GRIDFTP.STREAMS.BIG: Default number of streams to use for the transfer of a 'big' file

GRIDFTP.FILESIZE.THRESHOLD: The Threshold (given in MB) above which a file to transfer is considered to be "big"

```
# Example of layout for file
```

```
/opt/edg/etc/edg-replica-manager/edg-replica-manager.conf.values_local
```

```
@EDG.LOCATION@|/opt/edg|location of edg the directory
@LOCALDOMAIN@|cern.ch|the local domain
@DEFAULT.SE@|adc0033.cern.ch|the host of the close SE
@DEFAULT.CE@|adc0029.cern.ch|the host of the close CE
@INFOSERVICE@|MDS|The info provider to use. It can be Stub, MDS or RGMA
@RLS.MODE@|LrcOnly|The mode the RLS should be run in. LrcOnly or WithRli
@STUBFILE@|The properties file for the static file 'info service'
@MDS.HOST@|adc0031.cern.ch|The host of the MDS info provider
@MDS.PORT@|2170|The port of the MDS info provider
@ROS.FAILURE@|false|Fail if no ROS is available
@CONF.GCC@|_gcc3_2_2|The gcc suffix as used on the build box (empty for 2.95, _gcc3_2_2 for 3.2.)
@IGNORE.PREFIX@|true|If true, the lfn and guid prefix will not be passed to the
catalogs
@GRIDFTP.DCAU@|false|Does GridFTP use Data Channel Authentication (DCAU)
@GRIDFTP.STREAMS.SMALL@|1|The default number of stream to use for a small file
@GRIDFTP.STREAMS.BIG@|3|The default number of stream to use for a big file
@GRIDFTP.FILESIZE.THRESHOLD@|100|The Threshold (in MB) above which a file to transfer is considered "big"
```

5.2. RUN THE CONFIGURATION SCRIPT

Run (the –verbose flag is optional)

```
> /opt/edg/sbin/edg-replica-manager-configure /opt/edg/etc/edg-replica-manager/edg-replica-manager.conf.values_local [--verbose]
```

The file

```
/opt/edg/var/etc/edg-replica-manager/edg-replica-manager.conf
```

is modified accordingly as a result and should be checked to make sure it was edited properly!.

6. POOL ACCOUNTS

Pool accounts with the following characteristics have to be created on the RB.

6.1. LCG GROUPS

For every VO a corresponding group has to be created. For example for alice, atlas, cms, lhcb and dteam the following groups have to be created: alice atlas cms lhcb dteam

What follows is a production example

```
> groupadd -g 2688 dteam
> groupadd -g 1307 atlas
> groupadd -g 1470 lhcb
> groupadd -g 1399 cms
> groupadd -g 1395 alice
```

7. POOL USER NAMES

For every VO a corresponding set of users (with also a corresponding home directory in ”/home”) should be created.

Referring to the example of alice, atlas, cms, lhcb and dteam:

- Users of group alice:

```
alice001  
...

useradd -c "mapped user for group ID 1395" -u 17994 -g 1395 alice045
useradd -c "mapped user for group ID 1395" -u 17997 -g 1395 alice046
useradd -c "mapped user for group ID 1395" -u 17998 -g 1395 alice047
useradd -c "mapped user for group ID 1395" -u 18041 -g 1395 alice048
useradd -c "mapped user for group ID 1395" -u 18054 -g 1395 alice049
useradd -c "mapped user for group ID 1395" -u 18055 -g 1395 alice050
useradd -c "mapped user for group ID 1395" -u 18941 -g 1395 alicesgm
```

7.1. EXPERIMENT SOFTWARE MANAGER CONFIGURATION

For each VO group defined in 6. a special account to handle experiment software has to be created.

For example for alice, atlas, cms, lhcb and dteam the list of SGM user to be created would be:

alicesgm
atlassgm
cmssgm
lhcbsgm
dteamsgm

The following lines are a production example

```
useradd -c "mapped user for group ID 2688" -u 18946 -g 2688 dteamsgm
useradd -c "mapped user for group ID 1307" -u 18943 -g 1307 atlassgm
useradd -c "mapped user for group ID 1470" -u 18945 -g 1470 lhcbsgm
useradd -c "mapped user for group ID 1399" -u 18944 -g 1399 cmssgm
useradd -c "mapped user for group ID 1395" -u 18941 -g 1395 alicesgm
```

7.2. RB SPECIAL USERS AND GROUPS

Groups

edguser:x:995:
sshd:x:74:
edginfo:x:999:

Notice that reported above are the entries appearing in the file */etc/group*

Users

User *edguser* :

The user *edguser* belongs to the group *edguser* as well as *atlas*, *alice*, *cms*, *lhcb* and *dteam*

The user *edguser* has also a home directory in */home*.

Notice that many of the servers which run within the RB node are owned by the user *edguser* and so its presence is FUNDAMENTAL!!!

User *sshd*:

The user *sshd* belongs to the group *sshd*

The user `sshd` has NOT a home directory in `/home`. Rather, its home directory is `/var/empty/sshd` instead. Also notice that the default shell for this user should be `/bin/false`, i.e. no login is allowed under the `sshd` user.

The user `sshd` is normally created by newer versions of openssl and so is not created in a standard red hat 7.3.

User `edginfo`:

The user `edginfo` belongs to the group `edginfo`

The user `edginfo` has NOT a home directory in `/home`.
Rather, its home directory is `/opt/edg/var` instead.

Notice also that `edginfo` is not strictly required for the correct functioning of the node.

Reported below are the standard steps required to create all the relevant non general groups and users.

```
> groupadd -g 995 edguser
> groupadd -g 74 sshd
> groupadd -g 999 edginfo

> useradd -M -u 74 -g 74 -s /bin/false -d /var/empty/sshd sshd
> useradd -u 995 -g 995 -s /bin/bash edguser
> useradd -M -u 999 -g 999 -s /bin/bash -d /opt/edg/var edginfo

> gpasswd -a edguser dteam
> gpasswd -a edguser atlas
> gpasswd -a edguser lhcb
> gpasswd -a edguser cms
> gpasswd -a edguser alice
```

7.3. GLOBUS "GRIDMAPDIR" PATCH

- Create the directory `/etc/grid-security/gridmapdir`

```
> mkdir /etc/grid-security/gridmapdir
```

Now it is IMPORTANT to do

```
> chown root:edguser /etc/grid-security/gridmapdir
```

NOTICE however that the user and group ownerships of the files contained in the `gridmapdir` directory, e.g. `atlas001`, MUST be root, despite the fact that the `gridmapdir`'s group ID is `edguser`!

-
- For every Pool user name, a corresponding empty file with the same name should be created, e.g.

```
> touch /etc/grid-security/gridmapdir/atlas001
....
> touch /etc/grid-security/gridmapdir/dteam050
```

WARNING: Be careful not to create any other files than the pool user ones.

Namely, the "sgm" users used by the experiment software management system DO NOT need to be associated to files in the */etc/grid-security/gridmapdir* directory (see 7.1. below). The following is a full production example:

```

```

- Edit the crontab

```
> crontab -e
```

adding the line

```
0 5 * * * /opt/edg/sbin/lcg-expiregridmapdir.pl -v 1>>/var/log/lcg-expiregridmapdir.log 2>&1
```

8. GRIS CONFIGURATION

This section deals with the configuration of the Gris which publishes information about the Resource Broker, rendering it visible within the Grid.

8.1. INFO-PROVIDER.CONF

Create the directory `/opt/edg/var/info/`

```
> mkdir /opt/edg/var/info
```

Create and edit the file `/opt/edg/var/info/info-provider.conf` as follows

```
EDG_LOCATION=/opt/edg
GRID_INFO_USER=
REP_MET_PRESENT=no
REP_LOC_PRESENT=no
REP_OPT_PRESENT=no
SE_PRESENT=yes
```

8.2. LCG-INFO-WRAPPER

Create and edit the file `/opt/lcg/libexec/lcg-info-wrapper` as follows

```
#!/bin/sh
/opt/lcg/libexec/lcg-info-generic /opt/lcg/var/lcg-info-generic.conf
```

after which the command

```
> chmod a+wxr /opt/lcg/libexec/lcg-info-wrapper
```

should be launched.

8.3. INFORMATION PROVIDER

The information provider needs to be configured. In order to do so create and edit

`/opt/lcg/var/lcg-info-generic.conf` as follows:

```
ldif_file=/opt/lcg/var/lcg-info-static.ldif
generic_script=/opt/lcg/libexec/lcg-info-generic
wrapper_script=/opt/lcg/libexec/lcg-info-wrapper
template=/opt/lcg/etc/GlueService.template

dn: GlueServiceURI=gram://<NODE_NAME>:7772,Mds-vo-name=local,o=grid
GlueServiceAccessPointURL: gram://<NODE_NAME>:7772
GlueServiceType: ResourceBroker
GlueServicePrimaryOwnerName: LCG
GlueServicePrimaryOwnerContact: grid-testbed-managers@host.invalid
```

```
GlueServiceHostingOrganization: <HOSTING_ORG>
GlueServiceMajorVersion: 1
GlueServicePatchVersion: 1
GlueCEAccessControlBaseRule: <VIRTUAL_ORGANIZATION_1>
GlueCEAccessControlBaseRule: <VIRTUAL_ORGANIZATION_N>
GlueServiceInformationServiceURL: ldap://<NODE_NAME>:2135/mds-vo-name=local,o=grid
GlueServiceStatus: running
```

where <NODE_NAME> is the Resource Broker Node full Name; <HOSTING_ORG> is the Hosting Organization Name; <VIRTUAL_ORGANIZATION_1> to <VIRTUAL_ORGANIZATION_N> is the set of Virtual Organizations supported (so for every VO a corresponding line should be entered).

WARNING: PLEASE MAKE SURE THAT THE END OF LINE CHARACTER IS PRESENT AT THE END OF THE LAST LINE. IF NOT THE INFORMATION WILL BE BADLY PROCESSED AND IN THE END DISREGARDED!!!

A production example follows:

```
ldif_file=/opt/lcg/var/lcg-info-static.ldif
generic_script=/opt/lcg/libexec/lcg-info-generic
wrapper_script=/opt/lcg/libexec/lcg-info-wrapper
template=/opt/lcg/etc/GlueService.template

dn: GlueServiceURI=gram://lxshare0410.cern.ch:7772,Mds-vo-name=local,o=grid
GlueServiceAccessPointURL: gram://lxshare0410.cern.ch:7772
GlueServiceType: ResourceBroker
GlueServicePrimaryOwnerName: LCG
GlueServicePrimaryOwnerContact: mailto:hep-project-grid-cern-testbed-managers@cern.ch
GlueServiceHostingOrganization: CERN-TEST-LCG2
GlueServiceMajorVersion: 1
GlueServicePatchVersion: 1
GlueServiceAccessControlRule: alice
GlueServiceAccessControlRule: atlas
GlueServiceAccessControlRule: cms
GlueServiceAccessControlRule: lhcb
GlueServiceAccessControlRule: dteam
GlueServiceAccessControlRule: sixt
GlueServiceInformationServiceURL: ldap://lxshare0410.cern.ch:2135/mds-vo-name=local,o=grid
GlueServiceStatus: running
```

The script *lcg-info-generic-config* should then be launched in order to create the right configuration:

```
> /opt/lcg/sbin/lcg-info-generic-config lcg-info-generic.conf
```

Notice that the file */opt/lcg/var/lcg-info-static.ldif* will be created as a result. This file SHOULD NOT BE EDITED MANUALLY.

8.4. INFO PROVIDER INITIALIZATION SCRIPT

This step is required so as to define which Information Provider should be used by the GRIS.
In order to do so launch the setup script

```
> /opt/edg/sbin/edg-info-provider-setup
```

and after that the globus initialization script

```
> /opt/globus/sbin/globus-initialization.sh > globus-init.log 2>&1
```

8.5. START THE INFORMATION SERVICE

```
> /sbin/chkconfig globus-mds on  
> service globus-mds start
```

8.6. GRIS AND GIIS TEST

Test the GRIS and GIIS as follows:

```
> ldapsearch -h <RB-Hostname> -p 2135 -b "mds-vo-name=local,o=grid" -x  
> ldapsearch -h <GIIS Node> -p 2135 -b "mds-vo-name=<your-registration-name>,o=grid" -x
```

NOTE CAREFULLY:

In order for the Resource Broker to be *visible* the BDII has to contain the information relative to the GIIS node (e.g. a computing element) which also requires that the RB node be entered in the file */etc/globus* of the GIIS node itself.

Also notice that should there be a sizeable time difference between the RB and BDII, the latter one will not update the RB information, which is therefore lost.

9. RESOURCE BROKER SPECIFIC CONFIGURATION

9.1.

Proceed through the following steps as shown, to insure the correct ownership/permissions are set.

WARNING: Should any of the following steps be overlooked, the corresponding servers might not run properly and make any job submission fail as consequence!!!

Work Load Manager

In /var

```
> mkdir /var/edgwl
```

In /var/edgwl

```
> mkdir SandboxDir  
> mkdir -p networkserver/log  
> chmod g+w SandboxDir  
> mkdir -p workload_manager/log  
> mkdir -p jobcontrol/cond
```

In /var

```
> chown -R edguser:edguser edgwl
```

This last instruction is fundamental in setting the correct ownership!!!

/opt/edg/

Create the directory

/opt/edg/var/etc/profile.d

with

```
> mkdir -p /opt/edg/var/etc/profile.d
```

Copy from the directory

/opt/edg/etc/profile.d

the following files:

- *edg-wl.csh*

- *edg-wl.sh*

- *edg-wl-config.sh*

into the directory

/opt/edg/var/etc/profile.d

```
> cd /opt/edg/etc/profile.d  
> cp edg-wl.csh edg-wl.sh edg-wl-config.sh /opt/edg/var/etc/profile.d/
```

In */opt/edg/var*

```
> mkdir run  
> mkdir log
```

Condor

```
> mkdir -p /opt/condor/var/condor/log/GridLogs
```

In */opt/condor/var/condor/*

```
> mkdir spool
```

Now it is IMPORTANT to do:

In */opt/condor/var/*

```
> chown -R edguser:edguser condor
```

9.2. WORK LOAD CONFIG FILE

Create and edit the file */opt/edg/etc/edg_wl.conf* accordingly. The template of the file follows below. The file is standard and typically only your BDII node needs to be entered, i.e. <YOUR_BDII_NODE> in the *II_Contact* variable.

```
[  
  Common = [  
    DGUser = "${EDG_WL_USER}";  
    HostProxyFile = "${EDG_WL_TMP}/networkserver/ns.proxy";  
    UseCacheInsteadOfGris = true;  
  ];  
  JobController = [  
    CondorSubmit = "${CONDORG_INSTALL_PATH}/bin/condor_submit";
```

```
CondorRemove = "${CONDORG_INSTALL_PATH}/bin/condor_rm";
CondorQuery   = "${CONDORG_INSTALL_PATH}/bin/condor_q";
CondorSubmitDag = "${CONDORG_INSTALL_PATH}/bin/condor_submit_dag";
CondorRelease  = "${CONDORG_INSTALL_PATH}/bin/condor_release";

SubmitFileDialog = "${EDG_WL_TMP}/jobcontrol/submit";
OutputFileDialog = "${EDG_WL_TMP}/jobcontrol/condorio";
Input          = "${EDG_WL_TMP}/jobcontrol/queue.fl";
LockFile       = "${EDG_WL_TMP}/jobcontrol/lock";
LogFile        = "${EDG_WL_TMP}/jobcontrol/log/events.log";
ExternalLogFile = "${EDG_WL_TMP}/jobcontrol/log/external.log";

LogLevel = 5;

ContainerRefreshThreshold = 1000;
];

LogMonitor = [
    JobsPerCondorLog = 1000;
    LockFile = "${EDG_WL_TMP}/logmonitor/lock";
    LogFile = "${EDG_WL_TMP}/logmonitor/log/events.log";
    LogLevel = 5;
    ExternalLogFile = "${EDG_WL_TMP}/logmonitor/log/external.log";
    MainLoopDuration = 5;

    CondorLogDir = "${EDG_WL_TMP}/logmonitor/CondorG.log";
    CondorLogRecycleDir = "${EDG_WL_TMP}/logmonitor/CondorG.log/recycle";

    MonitorInternalDir = "${EDG_WL_TMP}/logmonitor/internal";
    IdRepositoryName = "irepository.dat";

    AbortedJobsTimeout = 600;
];
NetworkServer = [
    II_Port      = 2170;
    Gris_Port   = 2135;
    II_Timeout  = 30;
    Gris_Timeout = 20;
    II_DN       = "mds-vo-name=local, o=grid";
    Gris_DN     = "mds-vo-name=local, o=grid";
    II_Contact  = "<YOUR_BDII_NODE>";

    ListeningPort = 7772;
```

```
MasterThreads = 8;
DispatcherThreads = 10;
SandboxStagingPath = "${EDG_WL_TMP}/SandboxDir";

LogFile = "${EDG_WL_TMP}/networkserver/log/events.log";
LogLevel = 5;
BacklogSize = 16;
EnableQuotaManagement = false;
MaxInputSandboxSize = 10000000;
EnableDynamicQuotaAdjustment = false;
QuotaAdjustmentAmount = 10000;
QuotaInsensibleDiskPortion = 2.0;
];
WorkloadManager = [
    PipeDepth = 1;
    NumberOfWorkerThreads = 1;
    DispatcherType = "filelist";
    Input = "${EDG_WL_TMP}/workload_manager/input.fl";
    LogLevel = 6;
    LogFile = "${EDG_WL_TMP}/workload_manager/log/events.log";

    MaxRetryCount = 10;
];
]
```

9.3. CONDOR CONFIGURATION

The file

/opt/condor/etc/condor.conf

should be created and edited accordingly, as shown below:

```
# PART 1
#
CONDOR_HOST = $(FULL_HOSTNAME)

RELEASE_DIR = /opt/condor
LOCAL_DIR = /opt/condor/var/condor

CONDOR_ADMIN = `hep-project-grid-cern-testbed-managers@cern.ch`"
MAIL = /bin/mail

UID_DOMAIN = $(FULL_HOSTNAME)
FILESYSTEM_DOMAIN = $(FULL_HOSTNAME)

#
# PART 2
#
```

```
DAEMON_LIST = MASTER, SCHEDD

FLOCK_NEGOTIATOR_HOSTS = $(FLOCK_TO)

9.4. CONFIGURE THE MYSQL DATABASE FOR LB SERVER

```
> /sbin/chkconfig mysql on
> /etc/rc.d/init.d/mysql start
> mysqladmin password <YOUR_PASSWORD>
> mysqladmin -p create lbserver20
```

This command will require the password to be entered, e.g. "datagrid", as defined above!

Enter password: *****

```
> mysql -p lbserver20 < /opt/edg/etc/server.sql
```

This command will require the password to be entered, e.g. "datagrid" as defined above!

Enter password: *****

```
> mysql -p lbserver20
```

This command will require the password to be entered, e.g. "datagrid" as defined above!

Enter password: *****

After which mysql session will be started! Within the mysql session do the following:

```
> mysql> grant all on lbserver20.* to lbserver@localhost \g
> mysql> \qj
```

10. SERVERS START UP

10.1. FTPD

```
> /sbin/chkconfig edg-wl-ftpd on  
> /etc/rc.d/init.d/edg-wl-ftpd start
```

after which the following command should be always issued:

```
> /etc/rc.d/init.d/edg-wl-ftpd status
```

to check that the server is properly running!!!

10.2. L&B SERVER

```
> /sbin/chkconfig edg-wl-lbserver on  
> /etc/rc.d/init.d/edg-wl-lbserver start
```

After which the following command should be always issued:

```
> /etc/rc.d/init.d/edg-wl-lbserver status
```

to check that the server is properly running!!!

10.3. NETWORK SERVER

```
> /sbin/chkconfig edg-wl-ns on  
> /etc/rc.d/init.d/edg-wl-ns start
```

After which the following command should be always issued:

```
> /etc/rc.d/init.d/edg-wl-ns status
```

to check that the server is properly running!!!

10.4. WORKLOAD MANAGER

```
> /sbin/chkconfig edg-wl-wm on  
> /etc/rc.d/init.d/edg-wl-wm start
```

After which the following command should be always issued:

```
> /etc/rc.d/init.d/edg-wl-wm status
```

to check that the server is properly running!!!

10.5. JOBCONTROLLER DAEMON

```
> /sbin/chkconfig edg-wl-jc on  
> /etc/rc.d/init.d/edg-wl-jc start
```

After which the following command should be always issued:

```
> /etc/rc.d/init.d/edg-wl-jc status
```

to check that the server is properly running!!!

Notice that the Job controller relies on the file

/opt/condor/etc/condor.conf

being created and properly edited (see 7.2)!!!

10.6. LOGMONITOR DAEMON

```
> /sbin/chkconfig edg-wl-lm on  
> /etc/rc.d/init.d/edg-wl-lm start
```

After which the following command should be always issued:

```
> /etc/rc.d/init.d/edg-wl-lm status
```

to check that the server is properly running!!!

10.7. LOCALLOGGER SERVER

```
> /sbin/chkconfig edg-wl-locallogger on  
> /etc/rc.d/init.d/edg-wl-locallogger start
```

After which the following command should be always issued:

```
> /etc/rc.d/init.d/edg-wl-locallogger status
```

to check that the server is properly running!!!

11. FABRIC MONITORING BY GRIDICE

The CE, SE, and RB LCG nodes produce data for the GridICE monitoring system. The data are then sent to a collector server node which will then be queried by the LCG central GridICE monitoring service. If you are running agents you should also run a GridICE collector server to collect information from your agents.

In the default LCG-2 configuration the SE node runs the GridICE collector node. In Section 11.1. you can find the configuration of agents while section 11.2. deals with the configuration details for the GridICE collector server.

If you are doing a default LCG-2 configuration you should apply section 11.2. just to the SE.

Before going forward with configuration, please assure the following RPMs to be installed (they should have been distributed with the node RPMs).

edg-fabricMonitoring edt_sensor

11.1. SET-UP OF GRIDICE AGENTS

In order to enable GridICE agent on a LCG node:

- Create and configure the file /opt/edg/var/etc/edg-fmon-agent.conf as follows:

```
# Sensor file for edg-fmonagent
MSA
```

```
Transport

UDP
  Server <GridICE-collector-hostname>
  Port 12409
  FilterMetrics KeepOnly
    11001
    11011
    11021
    11101
    11202

WARNING: be very careful not to use <SPACE> characters to indent lines in this configuration file. Use <TAB> (or nothing) instead. The edg-fmon-agent does not allow spaces at the beginning of a row in the configuration file.

The parameter <GridICE-collector-hostname> is the complete hostname of the node that runs the GridICE collector server and publishes the data on the information system. The collector node will have to run a plain GRIS for this.

The information is sent to the collector node via UDP (port 12409)

Should you need to set up a GridICE collector node at your site use refer to section 11.1..

- start the GridICE agent

```
> chkconfig edg-fmon-agent on
> service edg-fmon-agent start
```

11.2. SET-UP OF A GRIDICE COLLECTOR SERVER

The Fabric Monitoring server can be installed on every node running a plain GRIS (e.g. Computing Element, Storage Element)

Fabric Monitoring server configuration

- Create (if needed) the directory

```
/opt/edg/var/etc
> mkdir /opt/edg/var/etc
```

- Create and edit as follows the file

```
/opt/edg/var/etc/edg-fmon-server.conf
```

```
SERVER_SPOOLDIR=/var/fmonServer
SERVER_PORT=12409
MR_SOAP_PORT=12411
```

- Start the Fabric Monitoring server

```
> chkconfig edg-fmon-server on
> service edg-fmon-server start
```

Start the GridICE Information service

```
> chkconfig gridice-mds on  
> service gridice-mds start
```

Configure extra info in the standard GRIS

- Edit the file /etc/globus.conf and insert the line

```
[mds/gris/provider/gridice]
```

between the line

```
[mds/gris/provider/edg]
```

and the line

```
[mds/gris/registration/site]
```

- Re-start the standard MDS

```
> service globus-mds restart
```

Set up Cron Table

The repository is cleaned daily : data is kept for last 5 days only

- Add the service to the crontab

```
> crontab -e
```

This will allow the editing of the crontable with the default editor, after which the following line has to be added:

```
43 1 * * * /opt/edg/sbin/edg-fmon-cleanspool &> /dev/null
```

12. RGMA CLIENT INSTALLATION

In what follows the installation and configuration of a standard RGMA producer is described. The producer component takes care of publishing information following the general RGMA architecture and as such should be installed in all those machines which need to be monitored (RGMA can in principle be used as an information system as well, however for the purpose of this document this will not be considered).

12.1. RGMA CONFIGURATION

ld.so.conf

Add to the file */etc/ld.so.conf* the following lines

```
/opt/edg/lib  
/opt/gcc-3.2.2/lib
```

Environmental Variables

Define the following environmental variables

```
> export RGMA_PROPS=/opt/edg/var/edg-rgma  
> export EDG_LOCATION_VAR=/opt/edg/var  
> export EDG_TMP=/tmp  
> export EDG_LOCATION=/opt/edg
```

Also MAKE SURE that */opt/edg/bin* is in the PATH

File /etc/sysconfig/edg

Create and edit the file

/etc/sysconfig/edg

as

```
# Root directory for EDG software. (mandatory)  
# Usual value: /opt/edg  
EDG_LOCATION=/opt/edg  
  
# Directory for machine-specific files.  
# Usual value: $EDG_LOCATION/var  
  
EDG_LOCATION_VAR=/opt/edg/var
```

```
# World writable directory for temporary files. (mandatory)
# Usual value: /tmp
EDG_TMP=/tmp

# The directory containing trusted certificates and CRLs (CERTDIR).
# Usual value: /etc/grid-security/certificates

# Host certificate (X509_USER_CERT) for services which don't have their own.
# Usual value: /etc/grid-security/hostcert.pem

# Host key (X509_USER_KEY) for services which don't have their own.
# Usual value: /etc/grid-security/hostkey.pem

# Location of the grid mapfile (GRIDMAP).
# Usual value: /etc/grid-security/grid-mapfile

# Location of the grid map directory for pooled accounts (GRIDMAPDIR).
# Usual value: /etc/grid-security/gridmapdir
```

Directory edg-rgma

Create the directory (if it does not exist already)

```
/opt/edg/var/edg-rgma
> mkdir -p /opt/edg/var/edg-rgma
```

Notice that this step is also performed by *edg-rgma-config* (See 12.2.)

RGMA Default Values

Create and edit the file

```
/opt/edg/var/edg-rgma/rgma-defaults
```

```
RGMA_PROPS=/opt/edg/var/edg-rgma
CATALINA_HOME=/var/tomcat4
JUNIT_JAR=_undefined_
```

```
LOG4J_JAR=/usr/share/java/log4j.jar
MYSQL_JAR=/usr/share/java/mm.mysql-2.0.14.jar
NETLOGGER_JAR=/usr/share/java/netlogger.jar
PREVAYLER_JAR=/usr/share/java/prevayler.jar
EDG_TRUST_SERVER_JAR=/opt/edg/share/java/edg-java-security-trustmanager.jar
EDG_AUTHORIZ_SERVER_JAR=/opt/edg/share/java/edg-java-security-authorization.jar
EDG_TRUST_CLIENT_JAR=/opt/edg/share/java/edg-java-security-trustmanager-client.jar
BOUNCYCASTLE_JAR=/usr/share/java/bcprov-jdk14.jar
JAVAACC_HOME=_undefined_
TEXDOCLET_JAR=_undefined_
INFO_JAR=/opt/edg/share/java/info.jar
SQLUTIL_JAR=/opt/edg/share/java/sqlutil.jar
rgma_c_API=_undefined_
RGMA_RPM_VERSION=3.4.31
GCC_VERSION=
SERLOC=<MON_NODE_NAME>
REGLOC=<REGISTRY_NODE_NAME>
SECURE=n
RegistryHosts=<REGISTRY_NODE_NAME>
RGMA_ROOT=/opt
```

where <MON_NODE_NAME> is the MON BOX machine name and <REGISTRY_NODE_NAME> is the REGISTRY machine name, whose default value is *lcgic01.gridpp.rl.ac.uk* in the current lcg version.

12.2. RGMA CONFIGURATION CREATION

Launch the following script to configure rgma

```
> /opt/edg/sbin/edg-rgma-config -q
```

13. CRON TABLE CONFIGURATION

The following production example of crontab should be taken as reference:

```
PATH=/sbin:/bin:/usr/sbin:/usr/bin

26 1,7,13,19 * * * /opt/edg/sbin/edg-mkgridmap --output=/etc/grid-security/gric
26 1,7,13,19 * * * /opt/edg/etc/cron/edg-fetch-crl-cron
26 2,8,14,20 * * * /sbin/service edg-wl-locallogger proxy
26 2,8,14,20 * * * /sbin/service edg-wl-lbserver proxy
26 2,8,14,20 * * * /sbin/service edg-wl-proxyrenewal proxy
26 2,8,14,20 * * * /sbin/service edg-wl-ns proxy
26 */1 * * 1-6 /opt/edg/libexec/edg-wl-purgestorage.sh hourly
26 */4 * * 0 /opt/edg/libexec/edg-wl-purgestorage.sh weekly
*/5 * * * * /opt/edg/libexec/edg-wl-check-daemons.sh
```

All those lines missing in the crontab of the machine under configuration should be added with the command

```
> crontab -e
```

via the crontab standard editor.

14. UPGRADE FROM THE PREVIOUS VERSION

This procedure is meant to help site administrators upgrade the node without starting an installation "from scratch", whenever possible.

The aim is to define those "delta" steps dealing both with installation and configuration phases. It is worthy of reminding that here "delta" refers to two contiguous software tags, the latter of which is the current one. Therefore, the procedure is not applicable to software versions more than two tags old.

WARNING: As a requirement for a successful upgrade, all the active servers which might be affected by the upgrade should be stopped.

The servers should be restarted once the installation and configuration described in the following sub paragraphs have been successfully done.

14.1. SOFTWARE INSTALLATION

The list "RB_manual_install_rpm", which has been described in 2., contains the latest version of the RB-related rpms to be installed. If the *rpm -i* command were launched as described in that section, a large number of conflicts would be issued because most of the packages would be reported to be already installed, some of which with the same version number, some others with an older one.

The easiest way to handle this situation is to download those rpms which should update the ones already installed on the node as well as any new ones.

The list of these rpms is contained in the file

RB_upgrade_rpm

whereas the list with the complete command lines for the download is contained in the file

RB_upgrade_wget

WARNING: This script will create a directory tree where the rpms are downloaded and needs to be launched once only.

After downloading the rpms, the first thing to do is to update the rpms within the directory *RB_UPGRADE*, by issuing the command

```
> rpm -U --oldpackage *.rpm"
```

A further list of rpms is provided, namely

RB_upgrade_forced_rpm

containing those new rpms whose dependencies are not dealt with, therefore requiring the installation to be "forced".

The same "wget" file

RB_upgrade_wget

takes also care to download the rpms of this final list in the directory

RB_UPGRADE_FORCED

The rpms listed in this directory should be installed with the command

```
> rpm -Uvh --force --nodeps " *.rpm"
```

Finally the list of rpms *RB_remove_rpm*

is provided which contains those packages which need to be removed; this is particularly likely to be necessary with CA-related rpms.

The rpm command to remove the listed rpms is

```
> rpm -e `cat RB_remove_rpm`
```

14.2. INSTALLING THE UP-TO-DATE CERTIFICATION AUTHORITY RPMS

As the list and structure of Certification Authorities (CA) accepted by the LCG project can change independently of the middleware releases, the rpm list related to the CAs certificates and URLs has been decoupled from the standard LCG release procedure. You should consult the page

<http://markusw.home.cern.ch/markusw/lcg2CAlist.html>

in order to ascertain what the version number of the latest set of CA rpms is. At time of writing it is 1.6, so the full set of rpms can be downloaded with the following command;

```
> wget -l1 -nd -r http://grid-deployment.web.cern.ch/grid-deployment/download/RpmDir/security/index_r1.6.html
```

These rpms should then be installed in the usual way;

```
> rpm -Uvh *.rpm
```

Changes and updates to these settings will be announced on the LCG-Rollout mailing list.

14.3. UPGRADE CONFIGURATION

- Check section 12. for the RGMA client installation.
- Edit the file */opt/edg/var/etc/edg-fmon-agent.conf*
and replace the line

```
CommandLine $(EDG_LOCATION)/libexec/edg-fmon-sensor-systemCheck
```

with the line

```
CommandLine $(EDG_LOCATION)/libexec/gridice-edg-fmon-sensor-systemCheck
```

Beware not to use spaces at the beginning of the line but to use three <TAB> characters.

Then re-start the GridICE agent

```
> service edg-fmon-agent restart
```

15. APPENDIX 1: STANDARD OUTPUT OF GLOBUS-INITIALIZATION.SH

16. APPENDIX 2: NON GENERAL LCG USERS AND GROUPS IDs

-Groups:

edguser:x:995:
sshd:x:74:
edginfo:x:999:

Notice that reported above are the entries appearing in the file */etc/group*

-Users:

User *edguser* :

The user *edguser* belongs to the group *edguser* as well as *atlas*, *alice*, *cms*, *lhcb* and *dteam*

The user *edguser* has also a home directory in */home*.

Notice that many of the servers which run within the RB node are owned by the user *edguser* and so its presence is fundamental!!!

User *sshd*:

The user *sshd* belongs to the group *sshd*

The user *sshd* has NOT a home directory in */home*. Rather, its home directory is */var/empty/sshd* instead. Also notice that the default shell for this user should be */bin/false*, i.e. no login is allowed under the *sshd* user.

The user *sshd* is normally created by newer versions of opelssl and so is not created in a standard red hat 7.3.

User *edginfo*:

The user *edginfo* belongs to the group *edginfo*

The user *edginfo* has NOT a home directory in */home*.
Rather, its home directory is */opt/edg/var* instead.

Notice also that *edginfo* is not strictly required for the correct functioning of the node.

16.1. PRODUCTION EXAMPLE

Reported below are the standard steps required to create all the relevant non general groups and users.

Groups creation

```
> groupadd -g 2688 dteam
> groupadd -g 1307 atlas
> groupadd -g 1470 lhcb
> groupadd -g 1399 cms
> groupadd -g 1395 alice

> groupadd -g 995 edguser
> groupadd -g 74 sshd
> groupadd -g 999 edginfo
```

Users creation

```
> useradd -M -u 74 -g 74 -s /bin/false -d /var/empty/sshd sshd
> useradd -u 995 -g 995 -s /bin/bash edguser
> useradd -M -u 999 -g 999 -s /bin/bash -d /opt/edg/var edginfo
```

Group members extension

```
> gpasswd -a edguser dteam
> gpasswd -a edguser atlas
> gpasswd -a edguser lhcb
> gpasswd -a edguser cms
> gpasswd -a edguser alice
```

CHANGE HISTORY

Table 1: Change History

<i>version</i>	<i>date</i>	<i>description</i>
v1.0	29/Jan/04	First Release
v1.1	29/Jan/04	Minor Corrections in 7) ??
v1.2	30/Jan/04	Restructure of paragraph ?? and insertion in "gridmapdir" Dir of LCG users files creation!
v1.3	30/Jan/04	Minor Corrections.
v1.4	30/Jan/04	Reshaping of the document and Minor Corrections.
v1.5	30/Jan/04	Minor Corrections.
v1.6	30/Jan/04	Minor Corrections in Appendix ??.
v1.7	02/Feb/04	Ref. [1] specified. Minor corrections.
v1.8	02/Feb/04	Minor corrections.
v1.9	03/Feb/04	Appendix ??: edguser and edginfo creation corrected.
v2.0	04/Feb/04	Paragraph ??: Few corrections of the mkdir instructions.
v2.1	06/Feb/04	Minor corrections. Paragraph ??: Few mistakes corrected! Section ?? added.
v2.2	09/Feb/04	Minor corrections.
v2.3	15/Feb/2004	Appendix ?? inserted. Reference to appendix ?? inserted
v2.4	23/Feb/2004	Appendix ?? changed: rpm lists have been changed.
v2.5	12/Mar/2004	Appendix ?? changed
v2.5.2	15/Mar/2004	?? GLOBUS_LOCATION environment variable to be defined before launching the initialization script
v2.5.3	16/Mar/2004	?? Installation procedure updated
v2.5.4	18/Mar/2004	Chapter ?? and ?? changed
v2.6.0	01/Apr/2004	?: cvs references changed
v2.6.1	20/Apr/2004	?? and ?? paragraph names changed
v2.7.0	21/Apr/2004	Correction in ?? for the file /opt/edg/etc/edg_wl.conf: II_Port = 2170;
v2.8.0	26/Apr/04	?: section inserted dealing with GridICE agent configuration. Upgrade section changed accordingly. Numbering changed consequently. - 9: section inserted dealing with Experiment Software Mangement tool (SGM) configuration. Upgrade section changed accordingly Numbering shifted up consequently.
v2.9.0	3/Aug/04	2.,14.: rpms dealing with CAs no more included in rpm lists.
v2.9.1	4/Aug/04	12.: rgma client installation included 11.1.: file /opt/edg/var/etc/edg-fmon-agent.conf changed (see 14.3. for details).
v2.9.2	10/Aug/04	12.: RGMA client configuration changed
v2.9.3	12/Aug/04	12.: configuration of file /opt/edg/var/edg-rgma/rgma-defaults changed
